Control And Optimization Of Distributed Generation Systems Power Systems:

Control and Optimization of Distributed Generation Systems Magdi S. Mahmoud, Fouad M. AL-Sunni, 2015-05-14 This text is an introduction to the use of control in distributed power generation. It shows the reader how reliable control can be achieved so as to realize the potential of small networks of diverse energy sources either singly or in coordination for meeting concerns of energy cost, energy security, and environmental protection. The book demonstrates how such microgrids interconnecting groups of generating units and loads within a local area can be an effective means of balancing electrical supply and demand. It takes advantage of the ability to connect and disconnect microgrids from the main body of the power grid to give flexibility in response to special events planned or unplanned. In order to capture the main opportunities for expanding the power grid and to present the plethora of associated open problems in control theory, *Control and Optimization of Distributed Generation Systems* is organized to treat three key themes: namely, system architecture and integration, modelling and analysis, and communications and control. Each chapter makes use of examples and simulations and appropriate problems to help the reader study. Tools helpful to the reader in accessing the mathematical analysis presented within the main body of the book are given in an appendix. *Control and Optimization of Distributed Generation Systems* will enable readers new to the field of distributed power generation and networked control, whether experienced academic migrating from another field or graduate student beginning a research career, to familiarize themselves with the important points of the control and regulation of microgrids. It will also be useful for practising power engineers wishing to keep abreast of changes in power grids necessitated by the diversification of generating methods. **Distributed Energy**

Conference Proceedings ,2001 *Conference Papers* ,2001 Control and Optimization of Power Systems with Renewables Baosen Zhang,2013 The electric power system is undergoing dramatic transformations due to the emergence of renewable resources However integrating these resources into the electric grid has proven to be difficult for two main reasons these resources are uncertain and distributed This thesis discusses how uncertainty and distributedness of the new resources are manifested as challenges in time and spatial scales and how we can optimally control the power grid to overcome these challenges The theme of this thesis is that in order to control the new resources we need a better understanding of the physical power flow in the system To illustrate the spatial scale challenge we consider the voltage regulation problem for distribution networks With a deep penetration of distributed energy resources the voltage magnitudes in a distribution system can fluctuate significantly To control these resources such that voltage profiles remain flat we need to coordinate the tens of thousands of households in the distribution network By studying the geometry of power flows in the network we show that even though the voltage regulation problem is non convex it can be convexified exactly through a semidefinite relaxation Based on this insight we an optimal and decentralized algorithm for this problem Only communication between electrical neighbors are required in the algorithm thus allowing it to scale to problem of large sizes The second problem we consider is dispatching generators in the transmission network under deep penetration of wind power Because of on off and ramp rate constraints traditional generators need to be dispatched before the actual time of delivery of energy On the other hand wind power cannot be dispatched and is difficult to predict in advance This creates a mismatch in time scale between the controls traditional generators and the randomness in the system wind We capture this challenge as a two stage stochastic dispatch problem In contrast to the standard Monte Carlo solutions we show that the dimensional of the problem can be reduced dramatically by using forecast informations This dimensional reduction is based on a better understanding of congested DC optimal power flow problems Using this reduction we show how to calculate the optimal reserve margin for the system in the presence of renewables and quantify the intrinsic impact of uncertainties on the system cost **Smart Power**
