

Getting Started

Introduction

Clarion is an infinitely adaptable environment, written to offer fast solutions at every skill level: from the business owner to the enterprise development team. Whatever your level coming in, Clarion will help you take control of your company data—more cost-effectively, and up to ten times faster than any other product out there today. Here's why...

Advanced code generator

Simply point to an existing database, or define a new one, and then use Clarion wizards to generate a full-featured business database application with advanced user interface functionality. The generated code includes complex features like multi-table joins, user authentication and access control, as well as functionality like filtering and sorting and reporting on any combination of database tables and records.

When you need a "business" application to maintain a database, you can literally do the job in minutes using Clarion. The key is the database dictionary. If the Application Generator knows what files or tables you want in the application, and how they're related, it can build an application. This is true regardless of where the files originated or in what format they are. So all you need to do is select one or more files, then indicate (when there are two or more files) the type of file relationships. The short Getting Started lessons herein demonstrate just how easy this whole process is.

The Application Wizard can then create a full-featured application using the Clarion default application metaphor. We call this the browse-form metaphor, and it extends directly from the structure of your database. The application works like this: (1) The end user navigates the database—all or part of it, one data file or multiple related data files—by scrolling through a list box, within which each item represents one record. The window in which this takes place is called a "browse." (2) The end user selects a specific record in the list to perform an action, such as editing the data. This generally occurs in a separate window, in which the database fields appear in separate edit boxes. This is called an update "form." A form may also accept new data. (3) Optionally, the end user can look up
