**Sustainable Green Chemical Processes and their Allied Applications** Inamuddin, Abdullah Asiri, 2020-05-30 Urbanization industrialization and unethical agricultural practices have considerably negative effects on the environment flora fauna and the health and safety of humanity Over the last decade green chemistry research has focused on discovering and utilizing safer more environmentally friendly processes to synthesize products like organic compounds inorganic compounds medicines proteins enzymes and food supplements These green processes exist in other interdisciplinary fields of science and technology like chemistry physics biology and biotechnology Still the majority of processes in these fields use and generate toxic raw materials resulting in techniques and byproducts which damage the environment Green chemistry principles alternatively consider preventing waste generation altogether the atom economy using less toxic raw materials and solvents and opting for reducing environmentally damaging byproducts through energy efficiency Green chemistry is therefore the most important field relating to the sustainable development of resources without harmfully impacting the environment This book provides in depth research on the use of green chemistry principles for a number of applications

***Enzymes from Extreme Environments*** Noha M. Mesbah, Felipe Sarmiento, 2016-08-05 Enzymes are nature's biocatalysts empowered with high catalytic power and remarkable substrate specificity Enzymes perform a wide range of functions throughout nature and guide the biochemistry of life with great precision The majority of enzymes perform under conditions considered normal for mesophilic neutrophilic terrestrial microorganisms However the Earth's biosphere contains several regions that are extreme in comparison such as hypersaline lakes and pools hydrothermal vents cold oceans dry deserts and

areas exposed to intensive radiation These areas are inhabited by a large number of extremophilic microorganisms which produce enzymes capable of functioning in unusual conditions There is an increasing biotechnological and industrial demand for enzymes stable and functioning in harsh conditions and over the past decade screening for isolation and production of enzymes with unique and extreme properties has become one of the foremost areas of biotechnology research The development of advanced molecular biology tools has facilitated the quest for production of enzymes with optimized and extreme features These tools include large scale screening for potential genes using metagenomics engineering of enzymes using computational techniques and site directed mutagenesis and molecular evolution techniques The goal of this Research Topic is to present reports on latest advances in enzymes from all types of extreme environments Contributions dealing with isolation of enzymes from extremophilic microorganisms or directly from natural environments screening for and expression of enzymes with extreme properties using metagenomic approaches are welcome In addition contributions dealing with all forms of biocatalyst production and improvement are welcome such as fermentation technology protein engineering directed evolution rational design and immobilization techniques

Abedon, Pilar García, Peter Mullany, Rustam Aminov, 2017-09-05 Historically the first observation of a transmissible lytic agent that is specifically active against a bacterium *Bacillus anthracis* was by a Russian microbiologist Nikolay Gamaleya in 1898 At that time however it was too early to make a connection to another discovery made by Dmitri Ivanovsky in 1892 and Martinus Beijerinck in 1898 on a non bacterial pathogen infecting tobacco plants Thus the viral world was discovered in two of the three domains of life and our current understanding is that viruses represent the most abundant biological entities on the planet The potential of bacteriophages for infection treatment have been recognized after the discoveries by Frederick Twort and Felix d H relle in 1915 and 1917 Subsequent phage therapy developments however have been overshadowed by the remarkable success of antibiotics in infection control and treatment and phage therapy research and development persisted mostly in the former Soviet Union countries Russia and Georgia as well as in France and Poland The dramatic rise of antibiotic resistance and especially of multi drug resistance among human and animal bacterial pathogens however challenged the position of antibiotics as a single most important pillar for infection control and treatment Thus there is a renewed interest in phage therapy as a possible additive alternative therapy especially for the infections that resist routine antibiotic treatment The basis for the revival of phage therapy is affected by a number of issues that need to be resolved before it can enter the arena which is traditionally reserved for antibiotics Probably the most important is the regulatory issue How should phage therapy be regulated Similarly to drugs Then the co evolving nature of phage bacterial host relationship will be a major hurdle for the production of consistent phage formulae Or should we resort to the phage products such as lysins and the corresponding engineered versions in order to have accurate and consistent delivery doses We still have very limited knowledge about the pharmacodynamics of phage therapy More data obtained in animal models are necessary to evaluate the phage therapy efficiency compared for example to antibiotics Another aspect is the safety of phage therapy How do phages interact with the immune system and to what costs or benefits What are the risks in the course of phage therapy of transduction of undesirable properties such as virulence or antibiotic resistance genes How frequent is the development of bacterial host resistance during phage therapy Understanding these and many other aspects of phage therapy basic and applied is the main subject of this Topic **2019 Rock Dynamics Summit** Ömer Aydan, Takashi
