Defect Correction Methods Defect Correction Methods:

Defect Correction Methods K. Böhmer, H.J. Stetter, 2012-12-06 Ten years ago the term defect correction was introduced to characterize a class of methods for the improvement of an approximate solution of an operator equation. This class includes many well known techniques e.g. Newton's method but also some novel approaches which have turned out to be quite efficient. Meanwhile a large number of papers and reports scattered over many journals and institutions have appeared in this area. Therefore a working conference on Error Asymptotics and Defect Corrections was organized by K. Böhmer, V. Pereyra and H.J. Stetter at the Mathematisches Forschungsinstitut Oberwolfach in July 1983, a meeting which aimed at bringing together a good number of the scientists who are active in this field. Altogether 26 persons attended whose interests covered a wide spectrum from theoretical analyses to applications where defect corrections may be utilized. A list of the participants may be found in the Appendix. Most of the colleagues who presented formal lectures at the meeting agreed to publish their reports in this volume. It would be presumptuous to call this book a state of the art report in defect corrections. It is rather a collection of snapshots of activities which have been going on in a number of segments on the frontiers of this area. No systematic coverage has been attempted. Some articles focus strongly on the basic concepts of defect correction but in the majority of the contributions the defect correction ideas appear rather as instruments for the attainment of some specified goal.

Defect Correction Methods for Fluid Flows at High Reynolds Numbers Alexander E. Labovsky, 2025-07-17 Defect Correction Methods for Fluid Flows at High Reynolds Numbers presents the mathematical development of defect correction methods (DCM) in application to fluid flow problems in various settings. We will show several approaches to applying the DCM ideas in computational fluid dynamics (CFD) from a basic idea of controlling the flow by the means of increased diffusion to the state of the art family of novel DCM based turbulence models. The main idea of the methods presented in this book is to use defect correction in turbulence modelling; additionally several methods will also be presented that aim at reducing the time discretization error. Features: Provides a road map starting from the ideas of minimally invasive controlling of turbulent flows to the ways of improving the existing regularization techniques with DCM to the ideas of full defect correction in both space and time and finally to the more complex embedding of the DCM into turbulence modelling by the correction of the whole turbulence model. Can be used for teaching a topics course on a Masters or Ph.D. level. It is even more suitable as a reference for CFD theorists and practitioners with most of the methods being minimally invasive and therefore easy to implement in the existing legacy codes. Discusses the current challenges in turbulence modelling with defect correction showing several possible directions for future developments. Two source codes are provided: one for a regularization technique and another for a novel turbulence model in order to give an interested researcher a quick start to the topic of DCM in CFD.

Splitting Methods for Time-dependent Partial Differential Equations P. J. van der Houwen, 1981 **Adaptive Defect Correction Methods for Viscous, Incompressible Flow Problems** V. Ervin, W. Layton, J. Maubach, 1998 **Defect Correction Methods for Computational Aeroacoustics** Liang Simon Lai, 2013 *Numerical Treatment of Coupled Systems* Wolfgang Hackbusch, 2013-04-17

The GAMM Committee for Efficient Numerical Methods for Partial Differential Equations organizes seminars and workshops on subjects concerning the algorithmic treatment of partial differential equations. The topics are discretisation methods like the finite element and the boundary element method for various type of applications in structural and fluid mechanics. Particular attention is devoted to the advanced solution methods. The series of such seminars was continued in 1995 January 20-22 with the 11th Kiel Seminar on the special topic Numerical Treatment of Coupled Systems at the Christian Albrechts University of Kiel. The seminar was attended by 100 scientist from 9 countries. 23 lectures were given including two survey lectures. Different kinds of couplings are considered in this volume. The coupling of different components may occur in the physical model. On the other hand a coupling of subsystems can be generated by the numerical solution technique. General examples of the latter kind are the domain decomposition see p 128 or subspace decomposition p 117. The local defect correction method couples different discretizations of the same problem in order to improve the results although the basic linear system to be solved remains unchanged p 47. In general the aim of the numerical coupling is to make use of efficient subsystem solvers p 1. The combination of different discretization techniques is mentioned on page 59.

Multigrid Methods Stephen F. McCormick, 1987-12-01. A thoughtful consideration of the current level of development of multigrid methods. This volume is a carefully edited collection of papers that addresses its topic on several levels. The first three chapters orient the reader who is familiar with standard numerical techniques to multigrid methods first by discussing multigrid in the context of standard techniques second by detailing the mechanics of use of the method and third by applying the basic method to some current problems in fluid dynamics. The fourth chapter provides a unified development complete with theory of algebraic multigrid AMG which is a linear equation solver based on multigrid principles. The last chapter is an ambitious development of a very general theory of multigrid methods for variationally posed problems. Included as an appendix is the latest edition of the Multigrid Bibliography an attempted compilation of all existing research publications on multigrid.

Further Analysis of the Local Defect Correction Method P. J. J. Ferret, Arnold Reusken, 1994 **Defect Correction Based Domain Decomposition Methods for Some Nonlinear Problems** Antony Siahhaan, 2011. Defect correction schemes as a class of nonoverlapping domain decomposition methods offer several advantages in the ways they split a complex problem into several subdomain problems with less complexity. The schemes need a nonlinear solver to take care of the residual at the interface. The adaptive solver can converge locally in the norm where the sufficient condition requires a relatively small local neighbourhood and the problem must have a strongly diagonal dominant Jacobian matrix with a very small condition number. Yet its advantage can be of high significance in the

computational cost where it simply needs a scalar as the approximation of Jacobian matrix Other nonlinear solvers employed for the schemes are a Newton GMRES method a Newton method with a finite difference Jacobian approximation and nonlinear conjugate gradient solvers with Fletcher Reeves and Pollak Ribiere searching direction formulas The schemes are applied to three nonlinear problems The first problem is a heat conduction in a multichip module where the domain is assembled from many components of different conductivities and physical sizes Here the implementations of the schemes satisfy the component meshing and gluing concept A finite difference approximation of the residual of the governing equation turns out to be a better defect equation than the equality of normal derivative Of all the nonlinear solvers implemented in the defect correction scheme the nonlinear conjugate gradient method with Fletcher Reeves searching direction has the best performance The second problem is a 2D single phase fluid flow with heat transfer where the PHOENICS CFD code is used to run the subdomain computation The Newton method with a finite difference Jacobian is a reasonable interface solver in coupling these subdomain computations The final problem is a multiphase heat and moisture transfer in a porous textile The PHOENICS code is also used to solve the system of partial differential equations governing the multiphase process in each subdomain while the coupling of the subdomain solutions is taken care of with some FORTRAN codes by the defect correction schemes A scheme using a modified method fails to obtain decent solutions in both single and two layers case On the other hand the scheme using the above Newton method produces satisfying results for both cases where it can lead an initially distant interface data into a good convergent solution However it is found that in general the number of nonlinear iteration of the defect correction schemes increases with the mesh refinement
