Gilbert, Robert Schreiber, Thomas Sheffler, 1994 We consider distribution at compile time of the array data in a distributed memory implementation of a data parallel program written in a language like Fortran 90 We allow dynamic redistribution of data and define a heuristic algorithmic framework that chooses distribution parameters to minimize an estimate of program completion time We represent the program as an alignment distribution graph We propose a divide and conquer algorithm for distribution that initially assigns a common distribution to each node of the graph and successively refines the assignment taking computation realignment and redistribution costs into account We explain how to estimate the effect of distribution on computation cost and how to choose a candidate set of distributions We present the results of an implementation of our algorithm on several test problems Page 1
