Concept Development Reflection And Refraction:

Optical Particle Sizing Gerard Gouesbet, Gerard Grehan, 2013-04-18 Optical particle sizing is undoubtedly a fascinating field of research of the utmost practical importance. In the Universe fluids are nearly everywhere and when they occur they almost invariably contain particles. Inside our bodies we can take the example of blood transporting a vital procession of red and white cells. Around us we can find various particles in the air we breathe bubbles in the champagne or the soda we drink or natural and artificial polluting particles in the lakes we swim in. Industrial processes and systems are also concerned with particles from pulverized coal flames to fluidized beds in a range of applications involving rocket exhausts pneumatic transport and more generally the infinite realm of multiphase situations. Such an obviously vast field would require a whole volume like this one merely to attempt to describe it superficially. To be sure we would need a scientific Prevert to catalogue such an endless inventory. Finally even outside our terrestrial spaceship particles can be detected in alien atmospheres or between stars. Theorists will enjoy analyzing the richness of light particle interaction a subject which is very far from being exhausted. Experimental researchers will love designing and studying various probing instruments with a laser source at the input and a computer at the output two requisites of today's technological revolution
