

Soil Correlations

This section of the Geotechnical Manual presents the SPT correlations to be used for friction angle (phi angle) and unit weight. The correlations use Standard Penetration Test (N) values corrected for overburden and hammer efficiency (N_{160}). Usage of correlations for geotechnical design is addressed in the various design sections of the Geotechnical Manual. Other correlations, e.g., CPT correlations and shear wave velocity correlations are found elsewhere in the Geotechnical Manual.

Cohesionless Soil: Friction Angle

Correlations of SPT blow counts to cohesionless soil friction angle and unit weight follow Bowles (1977) and are consistent with many of the text manuals used by the department. The correlations use Standard Penetration Test (N) values corrected for overburden and hammer efficiency (N_{160}).

Use Chart 1 to correlate N_{160} to the friction (phi) angle.

Choose the friction angle (expressed to the nearest degree) based upon the soil type, particle sizes, and rounding or angularity. Experience should be used to select specific values within the ranges. In general, finer materials or materials with significant (about 50%+) silty/sand material will fall in the lower portion of the range. Coarser materials

Fenton, D. V. Griffiths, 2008-09-02 NEW PROBABILISTIC APPROACHES FOR REALISTIC RISK ASSESSMENT IN GEOTECHNICAL ENGINEERING This text presents a thorough examination of the theories and methodologies available for risk assessment in geotechnical engineering spanning the full range from established single variable and first order methods to the most recent advanced numerical developments In response to the growing application of LRFD methodologies in geotechnical design coupled with increased demand for risk assessments from clients ranging from regulatory agencies to insurance companies authors Fenton and Griffiths have introduced an innovative reliability based risk assessment method the Random Finite Element Method RFEM

The authors have spent more than fifteen years developing this statistically based method for modeling the real spatial variability of soils and rocks. As demonstrated in the book, RFEM performs better in real world applications than traditional risk assessment tools that do not properly account for the spatial variability of geomaterials. This text is divided into two parts. Part One, Theory, explains the theory underlying risk assessment methods in geotechnical engineering. This part's seven chapters feature more than 100 worked examples enabling you to develop a detailed understanding of the methods. Part Two, Practice, demonstrates how to use advanced probabilistic tools for several classical geotechnical engineering applications. Working with the RFEM, the authors show how to assess risk in problems familiar to all geotechnical engineers. All the programs used for the geotechnical applications discussed in Part Two may be downloaded from the authors' Web site at www.engmath.dal.ca/rfem at no charge, enabling you to duplicate the authors' results and experiment with your own data. In short, you get all the theory and practical guidance you need to apply the most advanced probabilistic approaches for managing uncertainty in geotechnical design.
