Calendar Spread Options:

Calendar Spread Options for Storable Commodities Juheon Seok, 2013 Previous studies provide pricing models of options on futures spreads However none fully reflect the economic reality that spreads can stay near full carry for long periods of time A new option pricing model is derived that assumes convenience yield follows arithmetic Brownian motion that is truncated at zero The new models as well as alternative models are tested by testing the truth of their distributional assumptions for calendar spreads and convenience yield with Chicago Board of Trade corn calendar spreads Panel unit root tests fail to reject the null hypothesis of a unit root and thus support our assumption of arithmetic Brownian motion as opposed to a mean reverting process as is assumed in much past research The assumption that convenience yield follows a normal distribution truncated at zero is only approximate as the volatility of convenience yield never goes to zero Estimated convenience yields can be negative which is presumably due to measurement error Option payoffs are estimated with the four different models and the relative performance of models is determined using bias and root mean squared error RMSE The new model outperforms three other models and that the other models overestimate actual payoffs There is no significant difference in error variance for Hinz and Fehr Poitras and the new model and the error variance of the new model is smaller than that of Gibson and Schwartz

Department of Economics,2010 I analyze the theoretical problems associated with the pricing and hedging of calendar spread options and provide a useful closed form formula for valuation and risk management I focus specifically on the natural gas market and use data from the New York Mercantile Exchange s futures and options markets I provide a general overview of the role

spread options play in commodity markets and how they can be used as risk management tools or for speculative purposes The paper is focused on the day to day trading and valuing of calendar spread options using an adjusted Black Scholes framework and an extension of the Margrabe formula for exchange options The Black Scholes framework provides a simple but powerful valuation tool It is the language of choice in most market quoting conventions and that is why I chose this model to analyze The framework also provides us with closed form formulas for the risk sensitivities and hedge quantities I provide an in depth discussion of correlation the crucial quantity needed to value spread options Finally in the absence of liquid markets a second framework is provided to value and hedge calendar spread options based on historical data Principal component analysis is used to evaluate the covariance matrix of the forward curve and to model its evolution This method works well but caution always needs to be exercised when valuing future cash flows on historical data When possible forward looking market quotes are superior to historical Natural gas storage capacity has grown tremendously in the last decade creating a large share of market participants whose risk lies not with absolute prices but with calendar spread exposure and that is the inspiration for this paper **Advanced Options Trading** Robert T.
