*Embedded System Design* Peter Marwedel,2006-10-04 Until the late eighties information processing was associated with large mainframe computers and huge tape drives During the nineties this trend shifted towards information processing with personal computers or PCs The trend towards miniaturization continues In the future most of the information processing systems will be quite small and embedded into larger products such as transportation and fabrication equipment Hence these kinds of systems are called embedded systems It is expected that the total market volume of embedded systems will be significantly larger than that of traditional information processing systems such as PCs and mainframes Embedded systems share a number of common characteristics For example they must be dependable efficient meet real time constraints and require customized user interfaces instead of generic keyboard and mouse interfaces Therefore it makes sense to consider common principles of embedded system design Embedded System Design starts with an introduction into the area and a survey of specification languages for embedded systems A brief overview is provided of hardware devices used for embedded systems and also presents the essentials of software design for embedded systems Real time operating systems and real time scheduling are covered briefly Techniques for implementing embedded systems are also discussed using hardware software codesign It closes with a survey on validation techniques Embedded System Design can be used as a text book for courses on embedded systems and as a source which provides pointers to relevant material in the area for PhD students and teachers The book assumes a basic knowledge of information processing hardware and software

**Model-Based Engineering of Embedded Real-Time Systems** Holger Giese,Gabor Karsai,Edward A. Lee,Bernhard Rumpf,Bernhard Schätz,2010-10-09 The topic of Model Based Engineering of Real Time Embedded Systems brings together a challenging problem domain real time embedded systems and a fusion domain model based engineering It is also at the forefront of integrated software and systems engineering as software in this problem domain is an essential tool for system implementation and integration Today real time embedded software plays a crucial role in most advanced technical systems such as airplanes mobile phones and cars and has become the main driver and catalyst for innovation Development evolution verification configuration and maintenance of embedded and distributed software nowadays are often serious challenges as drastic increases in complexity can be observed in practice Model based engineering in general and model based software development in particular advocates the notion of using models throughout the development and life cycle of an engineered system Model based software engineering reinforces this notion by promoting models not only as the tool of abstraction but also as the tool for verification implementation testing and maintenance The application of such model based engineering techniques to embedded real time systems appears to be a good candidate to tackle some of the problems arising in the problem domain
