Methods for Distinguishing Nasal Consonants Meng Wang, 2003 Keywords digital signal processing statistics classification nasal consonants *Fundamentals of Signal Processing in Generalized Metric Spaces* Andrey Popoff, 2022-04-19 Exploring the interrelations between generalized metric spaces lattice ordered groups and order statistics the book contains a new algebraic approach to Signal Processing Theory It describes mathematical concepts and results important in the development analysis and optimization of signal processing algorithms intended for various applications The book offers a solution of large scale Signal Processing Theory problems of increasing both signal processing efficiency under prior uncertainty conditions and signal processing rate that is provided by multiplication free signal processing algorithms based on lattice ordered group operations From simple basic relationships to computer simulation the text covers a wide range of new mathematical techniques essential for understanding the proposed signal processing algorithms developed for solving the following problems signal parameter and spectral estimation signal filtering detection classification and resolution array signal processing demultiplexing and demodulation in multi channel communication systems and multi station networks wavelet analysis of 1D 2D signals Along with discussing mathematical aspects each chapter presents examples illustrating operation of signal processing algorithms developed for various applications The book helps readers understand relations between known classic and obtained results as well as recent research trends in Signal Processing Theory and its applications providing all necessary mathematical background concerning lattice ordered groups to prepare readers for independent work in the marked directions including more advanced research and development

Development of Digital Signal Processing and Statistical Classification Methods for Distinguishing Nasal Consonants, 2003 For almost half a century people have been looking for efficient classifiers to distinguish two nasal sounds from uttered by a single speaker From the middle of the last decade there has been little progress in research on this topic In recent years we researchers of the Voice I O Group in Department of Computer Science at North Carolina State University have conducted some new trials on this classical problem In this thesis those trials are briefly summarized Instead of simply using the Fourier transform to produce the spectra as people usually did in the past the author uses other kinds of

transforms to extract more feature differences between and The new transforms can be the alternatives of frequencies such as singular values or eigenvalues or even other transforms such as wavelets which can deal with non stationary systems quite well We combine together the old and new features to get a larger feature vector which will bring more classification information We collect multiple voice samples of a single speaker and calculate the above feature representations then use them as input of some popular statistical classification techniques such as Principle Component Analysis PCA Discriminant Analysis DA and Support Vector Machine SVM By way of one training process one testing process and one heuristic scheme we can identify the nasals with low error rates

Discrete Communication Systems Stevan Berber, 2021-07-19 This is the first textbook which presents the theory of pure discrete communication systems and its relation to the existing theory of digital and analog communications at a graduate level Based on the orthogonality principles and theory of discrete time stochastic processes a generic structure of communication systems based on correlation demodulation and optimum detection is developed and presented in the form of mathematical operators with precisely defined inputs and outputs and related functions Based on this generic structure the traditionally defined phase shift keying PSK frequency shift keying FSK quadrature amplitude modulation QAM orthogonal frequency division multiplexing OFDM and code division multiple access CDMA systems are deduced as its special cases The main chapters presenting the theory of communications are supported by a set of supplementary chapters containing the theory of deterministic and stochastic signal processing which makes the book a self contained presentation of the subject The book uses unified notation and unified terminology which allows a clear distinction between deterministic and stochastic signals power signals and energy signals discrete time signals and processes and continuous time signals and processes and an easy way of understanding the differences in defining the correlation functions power and energy spectral densities and amplitudes and power spectra of the mentioned signals and processes In addition to solved examples in the text about 300 solved problems are available to readers in the supplementary material that aim to enhance the understanding of the theory in the text In addition five research Projects are added to be used by lecturers or instructors that aim to enhance the understanding of theory and to establish its relation to the practice

Statistical Digital Signal Processing and Modeling Monson H. Hayes,1996-04-19 This new text responds to the dramatic growth in digital signal processing DSP over the past decade and is the product of many years of teaching an advanced DSP course at Georgia Tech While the focal point of the text is signal modeling it integrates and explores the relationships of signal modeling to the important problems of optimal filtering spectrum estimation and adaptive filtering Coverage is equally divided between the theory and philosophy of statistical signal processing and the algorithms that are used to solve related problems The text reflects the author s philosophy that a deep understanding of signal processing is accomplished best through working problems For this reason the book is loaded with worked examples homework problems and MATLAB computer exercises While the examples serve to illustrate the ideas developed in the book the problems seek to motivate and challenge the student and the computer exercises allow the student to experiment with signal processing algorithms on complex signals Professor Hayes is recognized as a leader in the signal processing community particularly for his work in signal reconstruction and image processing This text is suitable for senior graduate level courses in advanced DSP or digital filtering found in Electrical Engineering Departments Prerequisites include basic courses in DSP and probability theory
