Date:

Aim:

Write a program to implement the following operations on Binary Search Tree

a) Insert b) Delete c) Search d) Display

Description:

- Binary Search Tree is a binary tree in which every node contains only smaller values in its left subtree and only larger values in its right subtree. There must be no duplicate nodes.
- It is called a binary tree because each tree node has a maximum of two children.
- It is called a search tree because it can be used to search for the presence of a number in $O(\log(n))$ time.

The following operations are performed on a binary search tree...

1. Insertion
2. Search
3. Deletion

Procedure:

1. Insertion Operation in BST

In a binary search tree, the insertion operation is performed with $O(\log n)$ time complexity. In binary search tree, new node is always inserted as a leaf node.

The insertion operation is performed as follows...

- Step 1 - Create a newNode with given value and set its left and right to NULL.
- Step 2 - Check whether tree is Empty.
- Step 3 - If the tree is Empty, then set root to newNode.
- Step 4 - If the tree is Not Empty, then check whether the value of newNode is smaller or larger than the node (here it is root node).
- Step 5 - If newNode is smaller than or equal to the node then move to its left child. If newNode is larger than the node then move to its right child.
- Step 6- Repeat the above steps until we reach to the leaf node (i.e., reaches to NULL).
