Readings in Database Systems Joseph M. Hellerstein,Michael Stonebraker,2005 The latest edition of a popular text and reference on database research with substantial new material and revision covers classical literature and recent hot topics Lessons from database research have been applied in academic fields ranging from bioinformatics to next generation Internet architecture and in industrial uses including Web based e commerce and search engines The core ideas in the field have become increasingly influential This text provides both students and professionals with a grounding in database research and a technical context for understanding recent innovations in the field The readings included treat the most important issues in the database area the basic material for any DBMS professional This fourth edition has been substantially updated and revised with 21 of the 48 papers new to the edition four of them published for the first time Many of the sections have been newly organized and each section includes a new or substantially revised introduction that discusses the context motivation and controversies in a particular area placing it in the broader perspective of database research Two introductory articles never before published provide an organized current introduction to basic knowledge of the field one discusses the history of data models and query languages and the other offers an architectural overview of a database system The remaining articles range from the classical literature on database research to treatments of current hot topics including a paper on search engine architecture and a paper on application servers both written expressly for this edition The result is a collection of papers that are seminal and also accessible to a reader who has a basic familiarity with database systems

Interfaces to Database Systems (IDS94) Peter H. Sawyer,2013-11-11 A brief survey of the major DBMS and HeI conference proceedings over the past 10 years will reveal isolated pockets of research in database user interfaces but little

sense of being swept along with the general advances in DBMS technology and the new data models have evolved to meet the needs of different application domains persistent programming languages are blurring the traditional distinction between data definition and application programming languages distribution and interoperability have become issues as have the storage of heterogeneous media types yet it is still rare to read of the issues raised by these technological innovations being expressly addressed and rarer still to find recognition of the usability problems with longer established database technologies There are at least two reasons why this should be surprising Database systems are not like other computer systems existing both as back ends to other applications and as stand alone data stores they are typically slow deal with very large volumes of data and can involve all sorts of security confidentiality and even cooperability issues Databases are everywhere Perhaps only word processors and spread sheets are more widespread In addition as business cultures change and personal computing continues to mould expectations end users find themselves interacting increasingly closely with database systems

Modern Approaches for Intelligent Information and Database Systems Andrzej Sieminski, Adrianna Kozierkiewicz, Manuel Nunez, Quang Thuy Ha, 2018-02-23 This book offers a unique blend of reports on both theoretical models and their applications in the area of Intelligent Information and Database Systems The reports cover a broad range of research topics including advanced learning techniques knowledge engineering Natural Language Processing NLP decision support systems Internet of things IoT computer vision and tools and techniques for Intelligent Information Systems They are extended versions of papers presented at the ACIIDS 2018 conference 10th Asian Conference on Intelligent Information and Database Systems which was held in Dong Hoi City Vietnam on 19-21 March 2018 What all researchers and students of computer science need is a state of the art report on the latest trends in their respective areas of interest Over the years researchers have proposed increasingly complex theoretical models which provide the theoretical basis for numerous applications The applications in turn have a profound influence on virtually every aspect of human activities while also allowing us to validate the underlying theoretical concepts
