Database Systems Application Oriented Approach:

Database Systems Michael Kifer, Arthur J. Bernstein, Philip M. Lewis, 2006 This textbook explains the conceptual and engineering principles of database design. Rather than focusing on how to implement a database management system, it focuses on building applications and the theory underlying relational databases and relational query languages. An ongoing case study illustrates both database and software engineering concepts. Originally published as *Databases and Transaction Processing* by Pearson Education in 2002, the second edition adds a chapter on database tuning and a section on UML.

Database and Expert Systems Applications

A Min Tjoa, Isidro Ramos, 2012-12-06 The Database and Expert Systems Application DEXA conferences are mainly oriented to establish a state of the art forum on Database and Expert System applications. But Practice without Theory has no sense as Leonardo said five centuries ago. In this Conference we try a compromise between these two complementary aspects. A total of 5 sessions are application oriented, ranging from classical applications to more unusual ones in Software Engineering. Recent research aspects in Databases such as activity deductivity and/or Object Orientation are also present in DEXA 92 as well as the implication of the new data models such as OO Model, Deductive Model, etc. included in the Modelling sessions. Other areas of interest such as Hyper Text and Multimedia application together with the classical field of Information Retrieval are also considered. Finally Implementation Aspects are reflected in very concrete fields. A total of nearly 200 papers submitted from all over the world were sent to DEXA 92. Only 90 could be accepted. A Poster session has also been established. DEXA 90 was held in Vienna, Austria. DEXA 91 in Berlin, Germany and DEXA 92 will take place in Valencia, Spain, where we are celebrating the discovery of the New World just five centuries ago in Leonardo's age. Both the quality of the Conference and the compromise between Practice and Theory are due to the credit of all the DEXA 92 authors.

Advances in Object-Oriented Database Systems

Asuman Dogac,M.Tamer Özsü,Alexandros Biliaris,Timos Sellis,2013-11-09 Object oriented database management systems

OODBMSs have generated significant excitement in the database community in the last decade This interest stems from a real need for data management support for what are called advanced application areas that are not well served by relational technology The case for object oriented technology has been made on three fronts First is the data modeling requirements of the new applications Some of the more important shortcomings of the relational systems in meeting the requirements of these applications include 1 Relational systems deal with a single object type a relation A relation is used to model different real world objects but the semantics of this association is not part of the database Furthermore the attributes of a relation may come only from simple and fixed data type domains numeric character and sometimes date types Advanced applications require explicit storage and manipulation of more abstract types e g images design documents and the ability for the users to define their own application specific types Therefore a rich type system supporting user defined abstract types is required 2 The relational model structures data in a relatively simple and flat manner Non traditional applications require more complex object structures with nested objects e g a vehicle object containing an engine object
