**Articular Cartilage -- from Basic Science Structural Imaging to Non-invasive Clinical Quantitative Molecular Functional Information for AI Classification and Prediction** Bodo

Kurz,Thomas Lange,Marita Voelker,Melanie L. Hart,Bernd Rolauffs,2023 Abstract This review presents the changes that the imaging of articular cartilage has undergone throughout the last decades It highlights that the expectation is no longer to image the structure and associated functions of articular cartilage but instead to devise methods for generating non invasive function depicting images with quantitative information that is useful for detecting the early pre clinical stage of diseases such as primary or post traumatic osteoarthritis OA PTOA In this context this review summarizes a the structure and function of articular cartilage as a molecular imaging target b quantitative MRI for non invasive assessment of articular cartilage composition microstructure and function with the current state of medical diagnostic imaging c non destructive imaging methods c non destructive quantitative articular cartilage live imaging methods d artificial intelligence AI classification of degeneration and prediction of OA progression and e our contribution to this field which is an AI supported non destructive quantitative optical biopsy for early disease detection that operates on a digital tissue architectural fingerprint Collectively this review shows that articular cartilage imaging has undergone profound changes in the purpose and expectations for which cartilage imaging is used the image is becoming an AI usable biomarker with non invasive quantitative functional information This may aid in the development of translational diagnostic applications and preventive or early therapeutic interventions that are yet beyond our reach

Osteoarthritis OA is a degenerative joint disease that affects over 80% of the population of the U S by age 65 However there is currently no disease modifying treatment for OA In order to develop and evaluate potential treatments it is necessary to assess cartilage health over the course of the disease Here an MRI method is presented to obtain sodium images of tissue that pushes the current state of the art of sodium MRI and can provide new information about cartilage The method presented here enables sodium imaging at high resolution and with lower noise levels than previously reported This technique uses custom made radio frequency RF coils and a 3D cones k space trajectory and is well suited to imaging at high field strengths like 3 T and 7 T A second novel method is presented for generating high resolution 3D T2 and ADC maps of the human knee in vivo The maps are derived from diagnostic quality morphological MR images This method is based on a new variation of the 3D double echo steady state DESS sequence and solves many of the current challenges of traditional imaging techniques Finally a third method is presented allowing independent excitation of two or more volumes with a short RF pulse for MRI This method enables different volumes to be excited with different RF pulse parameters including flip angle slice profile or thickness phase modulation etc increasing the flexibility of the excitation In summary the techniques

presented here generate measurements of sodium T2 and ADC in cartilage all biomarkers of interest for this tissue These measurements are either less noisy or more efficiently obtained than with previous methods The methods presented in this dissertation also improve the efficiency of diagnostic image acquisition for the knee
