Emphasizing scientific and technological advances and focusing on clinical applications for patient diagnosis and management this volume provides a comprehensive interdisciplinary review of clinical exercise testing concentrating on Cardiopulmonary Exercise Testing (CPET). 25 reader friendly chapters discuss important topics including the physiologic responses to exercise in normal subjects in the aged and in various disease states, the set up of an exercise lab, the methodology and protocols used for clinical exercise testing and an integrative approach to the interpretation of CPET results. CPET in heart failure, deconditioning, COPD, ILD, pulmonary vascular disease, neuromuscular disease and asthma is thoroughly discussed. Clinical applications including pulmonary and cardiac rehabilitation, heart and lung transplantation, evaluation of unexplained exertional dyspnea, assessment for lung resection and lung volume reduction surgery and impairment/disability evaluation are also covered in detail. Additional chapters on clinical exercise testing in children during pregnancy and the postpartum and in other systemic disorders complete this extensive publication.
