Cisco 6500 VSS Configuration Example

2. Configure Virtual Switch Domain
3. Configure Virtual Switch Link
4. Execute Conversion
5. Verification

The Virtual Switching System (VSS) allows two Cisco Catalyst 6500 or 4500 chassis to bond together so that is seen as a single virtual switch to the rest of the network. Other devices will see the VSS configured 6500 as a single device which means it's possible to use multi-chassis etherchannel and protocols like spanning-tree will only see a single switch.

Some other features are NSF (Non Stop Forwarding) / SSO (Stateful Switchover) which means that when a single chassis fails the other one will take over without any downtime since the routing table / CEF table etc. are stored in both chassis' supervisors.

Another cool feature is EPSU (Enhanced Fast Software Upgrade) which allows you to upgrade the IOS version without any downtime.

In this lesson I will be using two Cisco Catalyst 6504 switches with 720-10G VSS supervisors to show you how to configure VSS and verify that it's working.

1.

Right now I have two 6500s that are running in "standalone". In order to bond these two using VSS we will have to do the following:

- Configure a **virtual switch domain** on both switches and configure one switch as "switch 1" and the other one as "switch 2".
- Configure the **virtual switch links**.
- Execute the **conversion** command which will reboot the switches.

Before we configure anything let's verify what modules my 6500s have and see if they are running the same IOS or not.
