Demineralization and Remineralization of Teeth Dr. Shandar Siddiqui, Dr. Imran Saba, 2020-10-14 Dental caries is defined as a multifactorial transmissible infectious oral disease caused primarily by the complex interaction of cariogenic oral flora biofilm with fermentable dietary carbohydrates on the tooth surface over time. At the tooth surface and sub surface level dental caries results from a dynamic process of attack demineralization and restitution remineralization of the tooth matter. It is essential to understand that carious lesions or cavitations in teeth are signs of an underlying condition an imbalance between protective factors i.e. those favouring remineralization and pathologic factors i.e. those favouring demineralization balance tilting towards the latter. In clinical practice it is very easy to lose sight of this fact and focus entirely on the restorative treatment of caries lesions failing to treat the underlying cause of the disease.
