EPABX: IP Is Future but Circuit Switch Stays

Technology Options

There has been a fundamental change in the way an enterprise views a PBX today. Ditto for the position that a PBX commands within an enterprise. Less than five years ago, PBX was not as central to the business as it is today. Today, many enterprises rely on it, as it offers them competitive advantage. Then PBX was just a voice switch, but today, it is a switch that can also facilitate data and video communication. In other words, it is the protagonist that would make convergence possible.

However, not all PBXs are like that. Nor would every enterprise need a PBX that is a powerful convergence tool. The Indian PBX market is still predominantly traditional, with voice being the prime application. And within voice, it is the call-switching function that is widely used. Features like voice-mail (that have long been available) are rarely used even by the most tech-savvy people. This is largely because people have never felt the need to do more. Time, however, is changing.

For an Indian enterprise today, there are four broad categories of technology options available to choose from. Even though the good old analog PBX is a passé in the rest of the world, it still survives here, in India. However, rarely would a new enterprise buyer find it attractive for his or her business. Then there is the feature-packed digital PBX available that an enterprise could rely on for efficiently managing its voice-related needs.

But the talk of the town today are the IP-enabled and pure IP PBXs. While an IP-enabled PBX is basically a circuit switch with an IP interface, a pure IP PBX is designed based on an IP platform. While both can enable VoIP, the former would permit a limited number of communication channels over IP and would require an intervening operator. On the other hand, a pure IP-based platform would incorporate RAS functionality and will allocate an unique IP address for each telephone, thereby permitting free and transparent connectivity with the

IP world, with the need for an intervening operator. The key point here is that IP offers unlimited functionality and applications that an enterprise would surely need for achieving its business goals more efficiently and cost-effectively. For example, an IP PBX would allow companies to do such things as video-conferencing and unified messaging from a single platform.

More importantly, upgrades are easy and less costly on non-proprietary, open-standard platforms, on which IP-PBXs are based, unlike the traditional switches that rely on vendor-owned closed and proprietary standards. This essentially means that if an enterprise wants to integrate new applications into the solution, it can always look for any vendor. On the other hand, the traditional PBX, with their closed and proprietary architecture, bind the user to one
