## **Communication Complexity And Parallel Computing:**

**Communication Complexity and Parallel Computing** Juraj Hromkovič, 1997-02-26 The communication complexity of two party protocols is an only 15 years old complexity measure but it is already considered to be one of the fundamental complexity measures of recent complexity theory Similarly to Kolmogorov complexity in the theory of sequential computations communication complexity is used as a method for the study of the complexity of concrete computing problems in parallel information processing Especially it is applied to prove lower bounds that say what computer resources time hardware memory size are necessary to compute the given task Besides the estimation of the computational difficulty of computing problems the proved lower bounds are useful for proving the optimality of algorithms that are already designed In some cases the knowledge about the communication complexity of a given problem may be even helpful in searching for efficient algorithms to this problem The study of communication complexity becomes a well defined independent area of complexity theory In addition to a strong relation to several fundamental complexity measures and so to several fundamental problems of complexity theory communication complexity has contributed to the study and to the understanding of the nature of determinism nondeterminism and randomness in algorithmics There already exists a non trivial mathematical machinery to handle the communication complexity of concrete computing problems which gives a hope that the approach based on communication complexity will be instrumental in the study of several central open problems of recent complexity theory

T. Kung, 1991 Also lower bounds on the communication cost are derived In particular it is shown that for each scheduling algorithm and for each positive  $\epsilon$  subscript C 1 which can be arbitrarily close to 0 there are values of  $N$   $h$   $d$   $p$  and  $\epsilon$  subscript T 0 for which if the parallel computation cost is between  $N$   $p$  the minimum and  $1 + \epsilon$  subscript T  $N$   $p$  then the communication cost must be at least  $1 + \epsilon$  subscript C times  $p d h$  Therefore the proposed scheduling algorithm is optimal with respect to the communication cost since the parallel computation cost of the algorithm is near optimal      Mathematical Foundations of Computer Science 2006 Rastislav Královic, Paweł Urzyczyn, 2006-08-29 This book constitutes the refereed proceedings of the 31st International Symposium on Mathematical Foundations of Computer Science MFCS 2006 The book presents 62 revised full papers together with the full papers or abstracts of 7 invited talks All current aspects in theoretical computer science and its mathematical foundations are addressed from algorithms and data structures to complexity automata semantics logic formal specifications models of computation concurrency theory computational geometry and more      *Structural Information and Communication Complexity* Andrzej Pelc, Michel Raynal, 2005-05-11 This book constitutes the refereed proceedings of the 12th International Colloquium on Structural Information and Communication Complexity SIROCCO 2005 held in Mont Saint Michel France in May 2005 The 22 revised full papers presented were carefully reviewed and selected from 48 submissions The papers address issues such as topics in distributed and parallel computing information dissemination communication complexity interconnection networks high speed networks wireless networking mobile computing optical computing and related areas
