

People and their discoveries

- The discovery of the genetic role of DNA began with research by Frederick Griffith in 1928. (When he mixed heat-killed remains of the pathogenic strain with living cells of the harmless strain, some living cells became pathogenic)
- In 1952, Alfred Hershey and Martha Chase used viruses that infected bacteria bacteriophages in their experiments.

- Hydrogen bonds form between base pairs.
- Chargaff's rule: in any organism the amount of A=T and G=C.
- Apples Trees / Car Garage "AT Co Gox"
- AG is pure (Purines = Double Rings)
- CT pyrimidines single ring

What does DNA look like?

- DNA is a polymer of nucleotides, each consisting of a nitrogenous base, a sugar, and a phosphate group.
- Chargaff's rule states that in any species, there is an equal number of A and T bases and an equal number of G and C bases.
- Pairing a purine with a pyrimidine resulted in a uniform width consistent with the X-ray.

Replication of DNA

- Experiments by Matthew Meselson and Franklin Stahl supported the semiconservative model.

Unwinding the DNA

- Helicase: enzymes that untwist the double helix.
- Single strand binding protein binds to and stabilizes single stranded DNA to keep it from reclosing.
- Topoisomerase corrects "overwinding" ahead of replication forks.

Base-Pairing

- DNA polymerases can't start synthesis of a polynucleotide; they can only add nucleotides to the 3' end.
- RNA polymerase starts RNA synthesis.
- DNA polymerase needs a primer to start DNA synthesis.
- RNA primase can start an RNA chain from scratch adding RNA nucleotides.
- An enzyme called DNA polymerase III catalyzes the elongation of new DNA at a replication fork.
- DNA polymerase III only travels in 5' to 3' direction.
- The leading strand is continuously made, moving toward the replication fork, while the lagging strand is made in small sections known as Okazaki Fragments.
 - Remember: a leading strand is the same direction as the replication fork, while the lagging strand is in the opposite strand.

Joining of the new strands

- Okazaki fragments are joined together by DNA ligase.

DNA polymerase 1 removes RNA nucleotides from the primer and adds nucleotides to the 3' end of the Okazaki fragments.
