

Label this neuron and show the path of an impulse with an arrow.

The image below shows how **serotonin** is released from the neuron and how a drug called **SSRI** (selective serotonin re-uptake inhibitors) is used to treat mood disorders. The neuron, like most cells of the body has mitochondria which provide the energy the cell needs to function. Color the mitochondria (A) orange. ☐ and the axon on the nerve cell (C) blue. ☐

The axon area contains the vesicles that store the neurotransmitters. These neurotransmitters are released into the synaptic cleft where they cross the gap and land on the receptors of the dendrites of the next neuron.

Color the axon (C) light blue. ☐ Color the neurotransmitters (E) red. ☐  
 Color the vesicles (D) pink. ☐ Color the receptors (G) green. ☐  
 Color the dendrite (F) yellow. ☐

The neurotransmitters are returned to the original cell through transporters, a process called re-uptake. As long as the neurotransmitter remains in the cleft, the receptors will continue to be stimulated. Certain drugs, called **SSRIs** can inhibit this re-uptake process, leaving the serotonin neurotransmitter active for longer within the cleft. This has an effect of elevating the person's mood or reducing anxiety and depression. Many anti-depressants are marketed as **SSRIs**.

Color the transporter (re-uptake area) purple. ☐ Color the inhibitor (F) brown. ☐
