Techniques provides an overview of a wide variety of characterization methods which makes it an excellent textbook and reference. It starts with a description of basic polymer science providing a solid foundation from which to understand the key physical characterization techniques. The authors explain physical principles without heavy theory and give special emphasis to the application of the techniques to polymers with plenty of illustrations. Topics covered include molecular weight determination, molecular and structural characterization by spectroscopic techniques, morphology and structural characterization by microscopy and diffraction and thermal analysis. This edition contains a new chapter on surface analysis as well as some revised problems and solutions. The concise treatment of each topic offers even those with little prior knowledge of the subject an accessible source to relevant simple descriptions in a well organized format. Techniques and Methods of Polymer Evaluation: Characterization and analysis of polymers by gas chromatography, by M. P. Stevens, Philip E. Slade, Lloyd T. Jenkins, 1966. **Characterization and Analysis of Polymers by Gas Chromatography**, Malcolm P. Stevens, 1969. Written primarily to help the polymer chemist in streamlining his analytical techniques. *Modern Methods of Polymer Characterization*, Howard G. Barth, Jimmy W. Mays, 1991-09-03. Presents the methods used for characterization of polymers. In addition to theory and basic principles, the instrumentation and apparatus necessary for methods used to study the kinetic and thermodynamic interactions of a polymer with its environment are covered in detail. Some of the methods examined include polymer separations and characterization by size exclusion and high performance chromatography, inverse gas chromatography, osmometry, viscometry, ultracentrifugation, light scattering and spectroscopy. **Polymer Surface Characterization**, Luigia Sabbatini, 2014-07-28. Polymer Surface Characterization provides a comprehensive approach to the surface analysis of polymers of technological interest by means of modern analytical techniques. Basic principles, operative conditions, applications, performance and limiting features are supplied together with current advances in instrumental apparatus. Each chapter is devoted to one technique and is self-consistent; the end of chapter references would allow the reader a quick access to more detailed information. After an introductory chapter, techniques that can interrogate the very shallow depth of a polymer surface, spanning from the top few angstroms in secondary ion mass spectrometry to 2-10 nm in X-ray photoelectron spectroscopy, are discussed, followed by Fourier transform infrared spectroscopy and chapters on characterization by scanning probe microscopy, electron microscopies, wettability and spectroscopic ellipsometry.

Characterization and Failure Analysis of Plastics, ASM International, Steve Lampman, 2003-01-01. The selection and application of engineered materials is an integrated process that requires an understanding of the interaction between materials, properties, manufacturing characteristics, design considerations and the total life cycle of the product. This reference book on engineering plastics provides practical and comprehensive coverage on how the performance of plastics is characterized during design, property testing and failure analysis. The fundamental structure and properties of plastics are reviewed for general reference and detailed articles describe the important design factors, properties and failure mechanisms.

Polymer Characterization Interdisciplinary Approaches Clara D. Craver, 2012-12-06 Physical and spectroscopic methods have been used jointly for characterization of polymers for at least four decades Yet new techniques permit increasingly refined determination of polymer chemistry and morphology_ The correlation of this knowledge with physical properties of polymers is helpful to planned synthesis of new products The most prominent spectroscopic techniques through the forties and fifties were infrared and ultraviolet spectroscopy Nuclear magnetic resonance electron spin resonance and Mossbauer spectroscopy started making significant contributions to polymer chemistry in the early sixties Still more

recently fluorescence spectroscopy and laser Raman spectroscopy have become readily applicable to polymers and are contributing significantly to the understanding of the relationship between polymer structure and properties. Determination of the distribution of monomer sequences by molecular size has become possible through combined gel permeation chromatography and spectroscopic analysis. Fragments of polymers from chemical breakdown or from pyrolysis are further fractionated and structurally analyzed. The relationship between the chemistry of polymers and performance can be determined from changes in chemical structure and orientation after curing, degradation or physical or thermal manipulation of the polymers.
