Design For Manufacturability With Advanced Lithography:

Design for Manufacturability with Advanced Lithography Bei Yu, David Z. Pan, 2015-10-28 This book introduces readers to the most advanced research results on Design for Manufacturability DFM with multiple patterning lithography MPL and electron beam lithography EBL The authors describe in detail a set of algorithms methodologies to resolve issues in modern design for manufacturability problems with advanced lithography Unlike books that discuss DFM from the product level or physical manufacturing level this book describes DFM solutions from a circuit design level such that most of the critical problems can be formulated and solved through combinatorial algorithms

Design for Manufacturability Artur Balasinski, 2013-10-05 This book explains integrated circuit design for manufacturability DfM at the product level packaging applications and applies engineering DfM principles to the latest standards of product development at 22 nm technology nodes It is a valuable guide for layout designers packaging engineers and quality engineers covering DfM development from 1D to 4D involving IC design flow setup best practices links to manufacturing and product definition for process technologies down to 22 nm node and product families including memories logic system on chip and system in package

Design for Manufacturing with Advanced Lithography Bei Yu, 2014 Shrinking the feature size of very large scale integrated circuits VLSI with advanced lithography has been a holy grail for the semiconductor industry However the gap between manufacturing capability and the expectation of design performance becomes critically challenged in sub 16nm technology nodes To bridge this gap design for manufacturing DFM is a must to co optimize both design and lithography process at the same time DFM for advanced lithography could be defined very differently under different circumstances In general progress in advanced lithography happens along three different directions 1 New patterning technique e g layout decomposition for different patterning techniques 2 New design methodology e g lithography aware standard cell design and physical design 3 New illumination system e g layout fracturing for EBL system stencil planning for EBL system In this dissertation we present our research results on design for manufacturing DFM with multiple patterning lithography MPL and electron beam lithography EBL addressing these three DFM research directions in advanced lithography For the research direction of new patterning technique we study the layout decomposition problems for different patterning technique and explore four important topics 1 layout decomposition for triple patterning 2 density balanced layout decomposition for triple patterning 3 layout decomposition for triple patterning with end cutting 4 layout decomposition for quadruple patterning and beyond We present the proof that triple patterning layout decomposition is NP hard Besides we propose a number of CAD optimization and integration techniques to solve different problems For the research direction of new design methodology we will show the limitation of traditional design flow That is ignoring triple patterning lithography TPL in early stages may limit the potential to resolve all the TPL conflicts We propose a coherent framework including standard cell compliance and detailed placement to enable TPL friendly design Considering TPL constraints during early design stages such as standard cell

compliance improves the layout decomposability With the pre coloring solutions of standard cells we present a TPL aware detailed placement where the layout decomposition and placement can be resolved simultaneously In addition we propose a linear dynamic programming to solve TPL aware detailed placement with maximum displacement which can achieve good trade off in terms of runtime and performance For the EBL illumination system we focus on two topics to improve the throughput of the whole EBL system 1 overlapping aware stencil planning under MCC system 2 L shape based layout fracturing for mask preparation With simulations and experiments we demonstrate the critical role and effectiveness of DFM techniques for the advanced lithography as the semiconductor industry marches forward in the deeper sub micron domain
