

**Question 10:** Summarize the important epidemiologic characteristics of the disease determined at this point.

In 1856, John Stuart Mills laid out a series of canons of inductive reasoning. Among them are:

- **The Method of Difference** - If two populations are similar except for one factor, then differences in disease may be hypothesized to be the result of the one difference.
- **The Method of Agreement** - If a number of populations share a common exposure to a factor, then occurrence of disease in all of these populations may be hypothesized to be the result of the common factor.
- **The Method of Concomitant Variation** - If amount of exposure and amount of disease

vary proportionally, then disease may be hypothesized to be the result of the exposure (basically, dose-response or ecologic correlation).

- **The Method of Residues** - If exposures can be removed or abated, then the factor that is associated with the greatest reduction in disease may be hypothesized to be a causal factor.
- **The Method of Analogy** - If the symptoms and mode of transmission of an unknown disease resemble those of a known disease, the causal factor(s) may be hypothesized to be similar.

**Question 11:** Using the information you have about Disease X or another newly identified disease, give an example of each canon.
