ASEXUAL

For each method of asexual reproduction there are two main types:

Binary fission

Budding

METAPHASE

For asexual reproduction:

The chromosomes are now free in the cytoplasm. Each centrosome has formed a spindle. Microtubules collectively known as the spindle. The chromosomes line up along the middle of the cell and split.

TELOPHASE

When the chromosomes reach the cell, they begin to spiral longer and thinner. A nuclear cell forms around each group, and the cytoplasm will all the process of cytokinesis.

These are two types of asexual reproduction:

During Prophase I, homologous are a pair. The non-sister chromatids are exchanged when the chromosomes are located off and exchanged. In this way, alleles are gene's separated.

What's this? Both of these processes are called. This is beneficial to ensure a better off if changes in some genes are affected by the recombination of genes.

Independent assortment

MEIOSIS

Meiosis is a process of cell division that produces four daughter cells.

Meiosis plays an important role in sexual reproduction, as it produces gametes (the eggs and sperm) and in asexual reproduction (mitosis). This occurs in the reproductive system. These cells are different from somatic cells, because they have half the number of chromosomes (a cell has the haploid number). When gametes fuse in the process of fertilization, the resulting cell has a full diploid cell.

Meiosis produces four daughter cells, each with a lower number of chromosomes than the parent cell.

Cell division is a process of cell division that produces four daughter cells.

MEIOSIS

Prophase I: Chromosomes are visible, and the cell is preparing for cell division.

Metaphase I: Chromosomes are aligned at the center of the cell.

Anaphase I: Chromosomes are moving to opposite poles.

Telophase I: Chromosomes have reached the poles, and the cell is dividing.

ENTROPHEM: Chromosomes are replicated.

PROPHASE II: Chromosomes are aligned at the center of the cell.

ANAPHASE II: Chromosomes are moving to opposite poles.
