ALGEBRAIC EXPRESSIONS & PROPERTIES

A variable is a symbol that is used to represent an unknown quantity. An algebraic expression is a mathematical expression that contains one or more variables, one or more numbers, and one or more arithmetic operations.

EX: 2

$$\begin{aligned}3 &= 3 \\4x &= 2x + 7 \\3x^2 &+ 7x = 1\end{aligned}$$

Order of Operations

The order of operations is a set of rules that determine which operations to perform first when evaluating a numerical expression.

1. Evaluate within grouping symbols.
2. Evaluate all powers.
3. Multiply and divide from left to right.
4. Add and subtract from left to right.

Properties of Real Numbers

For real numbers a , b , and c , the following properties are true.

Properties	Expression
Commutative Property of Addition	$a + b = b + a$
Commutative Property of Multiplication	$a \cdot b = b \cdot a$
Associative Property of Addition	$(a + b) + c = a + (b + c)$
Associative Property of Multiplication	$(a \cdot b) \cdot c = a \cdot (b \cdot c)$

Distributive Property
Additive Identity Property
Additive Inverse Property
Multiplicative Inverse Property

$$\begin{aligned}a + (b + c) &= a + b + a + c \\a + 0 &= a \\a + (-a) &= 0 \\a \cdot \left(\frac{1}{a}\right) &= 1, a \neq 0 \\a \cdot 0 &= 0\end{aligned}$$

Multiplicative Property of Zero

Parts of an Expression

A term is a number, variable, or the product of numbers and variables in an expression. Like terms are terms that have the same variables raised to the same powers. Two quantities that are being manipulated in an expression are called factors. The coefficient of a term is the numerical factor of the term. A term that consists of a number and no variables is called a constant.

REASONING WITH QUANTITIES

ALGEBRA

The units of a quantity can help you understand and solve multi-step problems.

Dimensional Analysis

Dimensional analysis is the process of using conversion factors to change from one set of units to another set of units.

EX: Angie jogged 495 feet in 45 seconds. What was her speed in miles per hour?

Write the given information as a ratio. Then use appropriate conversion factors to change units.

$$\begin{aligned}\frac{495 \text{ ft}}{45 \text{ s}} &= \frac{1 \text{ mi}}{5280 \text{ ft}} = \frac{1 \text{ mi}}{480 \text{ s}} && \text{Convert from feet to miles.} \\ \frac{1 \text{ mi}}{480 \text{ s}} &= \frac{60 \text{ mi}}{1 \text{ min}} = \frac{1 \text{ mi}}{8 \text{ min}} && \text{Convert from minutes to hours.}\end{aligned}$$

$$\frac{1 \text{ mi}}{8 \text{ min}} = \frac{60 \text{ mi}}{1 \text{ hr}} = \frac{7.5 \text{ mi}}{1 \text{ hr}}$$

Convert from minutes to hours.

Angie's speed was 7.5 miles per hour.

Modeling with Appropriate Units

When modeling with quantities, it is important to choose appropriate units.

EX: Suppose a tourist buys a map of Florida while on vacation. What might the scale of the map be? What units would represent the actual distance between cities?

The map is a small-scale drawing of the state. Distances on the map will be very small compared to the actual distances between cities. A scale for the map might be 1 cm = 250 km or 2 in. = 175 mi. The distances between the actual cities would be measured in miles or kilometers.

Accuracy & Precision

Accuracy describes how close a measured value is to the actual value.

EX: Thomas is 5 feet 10.25 inches tall. A measurement of 5 feet 10 inches is more accurate than a measurement of 6 feet when describing his height.

Precision describes the exactness of a measurement and is dependent on the unit of measure. The precision unit is the smallest unit on the tool being used to measure. As the units of measurement get smaller, the measurement goes more precise.

EX: A ruler that measures in millimeters is more precise than a ruler that measures in centimeters.

EX: For a scale that gives weight in pounds and ounces, the precision unit is ounces.

WRITING EQUATIONS

ALGEBRA

An equation is a number sentence that states that two quantities are equal to each other. The verbal expressions *equals*, *is*, *is equal to*, and *in the same as* indicate an equation.

Verbal Expressions

The sum of a number and 5 is equal to 12.

Frank separated his DVDs into 4 equal stacks of 15 each.

Equations

$$a + 5 = 12$$

$$a = 4 \cdot 15$$

Modeling with Equations

Equations can be used to model real-world situations and solve problems.

EX: Raggie's little sister is 3 years younger than him. The sum of their ages is 27 years. How old is Raggie?

- Define a variable.
- Let a represent Raggie's age.
- Translate the verbal description into an equation.

Raggie's age: a

Raggie's sister's age: $a - 3$

Sum of their ages: $a + (a - 3)$

Because the sum of their ages is 27 years, the equation $a + (a - 3) = 27$ models the situation.

You can verify that the solution to the equation is $a = 15$. So, Raggie is 15 years old. In the next section, you will learn several methods for solving equations.

SOLVING EQUATIONS

ALGEBRA

You can use the following properties of equality to solve equations.

- **Addition Property of Equality:** If you add the same number to both sides of an equation, the two sides remain equal.
- **Subtraction Property of Equality:** If you subtract the same number from both sides of an equation, the two sides remain equal.
- **Multiplication Property of Equality:** If you multiply both sides of an equation by the same number, the two sides remain equal.
- **Division Property of Equality:** If you divide both sides of an equation by the same nonzero number, the two sides remain equal.

Solving Multi-step Equations

Equations that have multiple operations and more complicated expressions are called multi-step equations. To solve these types of equations, simplify both sides as much as you can and use the properties you have learned to undo the operations.

EX: A coin-operated car wash costs \$1.75 plus \$0.50 per minute of use. Shawna spent \$27.75 using the car wash. Solve the equation $1.75 + 0.5x = 27.75$ to find the number of minutes, x , that she used the car wash.

$$\begin{aligned}1.75 + 0.5x &= 27.75 \\1.75 - 1.75 + 0.5x &= 27.75 - 1.75 \\0.5x &= 26 \\2(0.5x) &= 2(26) \\x &= 12\end{aligned}$$

Shawna used the car wash for 12 minutes.

Original equation

Subtract 1.75

from each side

Simplify

Multiply each

side by 2

Simplify

Math Practice 3:

Construct viable arguments and critique the reasoning of others.

Each time you apply a property of real numbers or a property of equality to transform an equation, you can justify that both sides of the equation are still equal. As you solve equations, think about which property allows you to transform it into an equivalent form.

Arithmetic Counts! Paul Shoecraft,2025-01-24 Dr Shoecraft may be the only mathematician since the New Math in the 1960s to seriously analyze the lowly subject of arithmetic and how to teach it His breakthrough came when he experimented with teaching what needs to be understood instead of known memorized like teaching why addition problems until the algorithm they are using supposedly becomes cemented in their brains By teaching the essence of arithmetic in sensible ways and appealing to children s love of games songs and movement he s proven that virtually ALL children can learn arithmetic the foundation of algebra higher mathematics science technology and more even music When children understand arithmetic they own it It s no lonver just their teacher s math It s their math America s children are being held back in math because of how arithmetic is drug out in elementary school Virtually every textbook based elementary school math program in use today is mind numbing in its repetitiveness from grade to grade The reason for the redundancy is to slow down the teaching of arithmetic so it can be memorized Research shows that the human brain is not designed to remember things learned by rote when no longer practiced That s acknowledged in the use it or lose it aphorism that states the obvious that we remember what we use and forget what we don t You know that to be true if you ve ever forgotten things you once knew as well as your own name things like an old address or a license plate number Every child can understand base ten numeration when taught hands on with arithmetic blocks Thereby every child can understand base ten arithmetic And every child can learn how to count out the number facts like 5 7 12 17 8 9 6 X 7 42 and 56 7 8 and if they forget one never have to guess and risk ridicule and bad grades if they guess wrong What matters in teaching arithmetic is not how much a child can remember but how much they can figure out if when they forget
