## The Complete Solution of Descriptive Geometry:
Finding any arbitrary auxiliary view

**The final question is: How can we describe *any arbitrary* view of the object?**

Summary of our work so far:

1. **Any two orthogonal adjacent views completely describe the locations of the object points in space.** Think first of the top view and front view, for example: the top view completely describes the width and depth positions, while the front view describes the height and width. These two adjacent orthogonal views, which share one dimension, completely locate the points in all three dimensions of space.

2. The side view is easy to construct now. The image of the side viewing plane is a line in both the top view and the front view, since that plane is orthogonal to both. By projecting the spacing along the dimension out to the right onto the line representing the side view we locate the widths for that view. By projecting the spacing along the heights of the front view onto the line representing the side view plane, we locate the heights for the side view.

3. **A view at an arbitrary rotation about a vertical axis, is just like the side view.** We noted that any view between the front and side, or any view that is a similar vertical sectioning of the box (parallel to the *height* dimension), will also appear as a line in the top view. We can thus choose an arbitrary vertical plane and project the points onto the line representing it in the top view. This locates the widths for the new view. The heights are the same as for the front or side (all such vertical viewing planes have the same heights).

4. **The same idea extends to an arbitrary rotation about a horizontal axis.** This same procedure works for any arbitrary horizontal sectioning, that is, a plane that is parallel to the *depth* dimension for example. These appear as lines in the front view, and projecting the points onto that line locates the new heights for the desired view. The widths will all be the same as those in the side view. In fact all sections parallel to the depth dimension have the same widths (those that are the same as the side view).
