**Clustering** Sander van Vugt,2014-07-25 Pro Linux High Availability Clustering teaches you how to implement this fundamental Linux add on into your business Linux High Availability Clustering is needed to ensure the availability of mission

critical resources. The technique is applied more and more in corporate datacenters around the world. While lots of documentation about the subject is available on the internet, it isn't always easy to build a real solution based on that scattered information which is often oriented towards specific tasks only. Pro Linux High Availability Clustering explains essential high availability clustering components on all Linux platforms, giving you the insight to build solutions for any specific case needed. In this book, four common cases will be explained: Configuring Apache for high availability, Creating an Open Source SAN based on DRBD, iSCSI and HA clustering, Setting up a load balanced web server cluster with a back end highly available database, Setting up a KVM virtualization platform with high availability protection for a virtual machine. With the knowledge you'll gain from these real world applications, you'll be able to efficiently apply Linux HA to your work situation with confidence. Author Sander Van Vugt teaches Linux high availability clustering on training courses, uses it in his everyday work and now brings this knowledge to you in one place with clear examples and cases. Make the best start with HA clustering with Pro Linux High Availability Clustering at your side.

**Kubernetes Management Design Patterns** Deepak Vohra, 2017-01-20

Take container cluster management to the next level: learn how to administer and configure Kubernetes on CoreOS and apply suitable management design patterns such as Configmaps, Autoscaling, elastic resource usage and high availability. Some of the other features discussed are logging, scheduling, rolling updates, volumes, service types and multiple cloud provider zones. The atomic unit of modular container service in Kubernetes is a Pod, which is a group of containers with a common filesystem and networking. The Kubernetes Pod abstraction enables design patterns for containerized applications similar to object oriented design patterns. Containers provide some of the same benefits as software objects such as modularity or packaging abstraction and reuse. CoreOS Linux is used in the majority of the chapters and other platforms discussed are CentOS with OpenShift, Debian 8 Jessie on AWS and Debian 7 for Google Container Engine. CoreOS is the main focus because Docker is pre-installed on CoreOS out of the box. CoreOS supports most cloud providers including Amazon AWS EC2 and Google Cloud Platform and virtualization platforms such as VMWare and VirtualBox. Provides Cloud Config for declaratively configuring for OS items such as network configuration, flannel storage, etcd and user accounts. Provides a production level infrastructure for containerized applications including automation, security and scalability. Leads the drive for container industry standards and founded appc. Provides the most advanced container registry Quay. Docker was made available as open source in March 2013 and has become the most commonly used containerization platform. Kubernetes was open sourced in June 2014 and has become the most widely used container cluster manager. The first stable version of CoreOS Linux was made available in July 2014 and since has become one of the most commonly used operating system for containers. What You'll Learn: Use Kubernetes with Docker, Create a Kubernetes cluster on CoreOS on AWS, Apply cluster management design patterns, Use multiple cloud provider zones, Work with Kubernetes and tools like Ansible, Discover the Kubernetes based PaaS platform OpenShift, Create a high availability website, Build a high availability Kubernetes master.
