

TESTS AND MAINTENANCE OF "DELCOTRONS"*

(3.5" FRAME DIAMETER

CONTINUOUS-OUTPUT, DIODE-RECTIFIED A.C. GENERATORS)

Figure 1—Typical "Delcotron"

INTRODUCTION

"Delcotrons" are designed and constructed to give long periods of trouble-free service with a minimum amount of maintenance. The rotor is mounted on a ball bearing at the drive end, and a roller bearing at the slip ring end, and each bearing has a grease supply which eliminates the need for periodic lubrication. Two brushes are used to carry current through the two slip rings to the field coil which is mounted on the rotor. The brushes are extra long and under normal operating conditions will provide long periods of service.

The stator windings are assembled on the inside of a laminated core that forms part of the "Del-

cotron" frame. Six rectifier diodes are mounted in the slip ring end frame and are connected to the stator windings. The six diodes replace the separately mounted rectifier as used in other types of applications, and they act to change the "Delcotron" a.c. voltages to d.c. voltage which appears at the "BAT" terminal on the "Delcotron". A capacitor, or condenser, mounted in the end frame protects the diodes from high voltages.

An external view of a typical "Delcotron" is shown in Figure 1, a cross-sectional view is illustrated in Figure 2, and a wiring diagram is shown in Figure 3.
