*Proceedings* ,1994 [Efficient Design of Variation-Resilient Ultra-Low Energy Digital Processors](#) Hans Reyserhove,Wim Dehaene,2019-03-27 This book enables readers to achieve ultra low energy digital system performance The author s main focus is the energy consumption of microcontroller architectures in digital sub systems The book covers a broad range of topics extensively from circuits through design strategy to system architectures The result is a set of techniques and a context to realize minimum energy digital systems Several prototype silicon implementations are discussed which put the proposed techniques to the test The achieved results demonstrate an extraordinary combination of variation resilience high speed performance and ultra low energy [ISTFA 2017: Proceedings from the 43rd International Symposium for Testing and Failure Analysis](#) ASM International,2017-12-01 The theme for the November 2017 conference was Striving for 100% Success Rate Papers focus on the tools and techniques needed for maximizing the success rate in every aspect of the electronic device failure analysis process [Proceedings of the ... [GLSVLSI '05](#) ,2005 [VLSI Design Methodologies for Digital Signal Processing Architectures](#) Magdy A. Bayoumi,2012-12-06 Designing VLSI systems represents a challenging task It is a transfonnation among different specifications corresponding to different levels of design abstraction behavioral stntctural and physical The behavioral level describes the functionality of the design It consists of two components static and dynamic The static component describes operations whereas the dynamic component describes sequencing and timing The structural level contains infonnation about components control and connectivity The physical level describes the constraints that should be imposed on the floor plan the placement of components and the geometry of the design Constraints of area speed and power are also applied at this level To implement such multilevel transfonnation a design methodology should be devised taking into consideration the constraints limitations and properties of each level The mapping process between any of these domains is non isomorphic A single behavioral component may be transfonned into more than one structural component Design methodologies are the most recent evolution in the design automation era which started off with the introduction and subsequent usage of module generation especially for regular structures such as PLA s and memories A design methodology should offer an integrated design system rather than a set of separate unrelated routines and tools A general outline of a desired integrated design system is as follows Decide on a certain unified framework for all design levels Derive a design method based on this framework Create a design environment to implement this design method [\*\*Analog Layout Generation for Performance and Manufacturability\*\*](#) Koen Lampaert,Georges Gielen,Willy M.C. Sansen,2013-04-18 Analog integrated circuits are very important as interfaces between the digital parts of integrated electronic systems and the outside world A large portion of the effort involved in designing these circuits is spent in the layout phase Whereas the physical design of digital circuits is automated to a large extent the layout of analog circuits is still a manual time consuming and error prone task This is mainly

due to the continuous nature of analog signals which causes analog circuit performance to be very sensitive to layout parasitics. The parasitic elements associated with interconnect wires cause loading and coupling effects that degrade the frequency behaviour and the noise performance of analog circuits. Device mismatch and thermal effects put a fundamental limit on the achievable accuracy of circuits. For successful automation of analog layout advanced place and route tools that can handle these critical parasitics are required. In the past automatic analog layout tools tried to optimize the layout without quantifying the performance degradation introduced by layout parasitics. Therefore it was not guaranteed that the resulting layout met the specifications and one or more layout iterations could be needed. In *Analog Layout Generation for Performance and Manufacturability* the authors propose a performance driven layout strategy to overcome this problem. In this methodology the layout tools are driven by performance constraints such that the final layout with parasitic effects still satisfies the specifications of the circuit. The performance degradation associated with an intermediate layout solution is evaluated at runtime using predetermined sensitivities. In contrast with other performance driven layout methodologies the tools proposed in this book operate directly on the performance constraints without an intermediate parasitic constraint generation step. This approach makes a complete and sensible trade off between the different layout alternatives possible at runtime and therefore eliminates the possible feedback route between constraint derivation placement and layout extraction. Besides its influence on the performance layout also has a profound impact on the yield and testability of an analog circuit. In *Analog Layout Generation for Performance and Manufacturability* the authors outline a new criterion to quantify the detectability of a fault and combine this with a yield model to evaluate the testability of an integrated circuit layout. They then integrate this technique with their performance driven routing algorithm to produce layouts that have optimal manufacturability while still meeting their performance specifications. *Analog Layout Generation for Performance and Manufacturability* will be of interest to analog engineers, researchers and students.

Automation Frameworks F. J. Rammig, Ron Waxman, 1991 During the last decade the field of electronic design automation has changed from a small industry offering a random sampling of commercial and academic design automation tools to a significant industry comprising offerings ranging from individual tools to total design systems all based upon a set of emerging standards. Workers in electronic design automation are active in the development of integrated design environments and therefore in the development of frameworks. Frameworks for electronic design automation are rather similar to those for mechanical or software engineering however the class of tools may differ resulting in differing specific requirements for the services to be offered. The present book documents the results of the 2nd Workshop on electronic design automation frameworks. The question of standardization is of special interest within the book especially as related to VHDL.
