Peterson,Maurice F. Prout,Robert A. Schwarz,1991-01-31 For hundreds of years the human response to personal and collective catastrophe has been recognized

Major historical events of the twentieth century have highlighted the reality of the human response to extreme traumatization especially the experience of persons exposed to the concentration camps of Nazi Germany the dropping of atomic bombs on Hiroshima and Nagasaki and the unique features of the Vietnam conflict. However it was not until 1980 with the publication of the third edition of the Diagnostic and Statistical Manual DSM 111 that post traumatic stress disorder PTSD was fully recognized as a distinct and valid diagnostic category with a permanency not hitherto afforded post trauma stress syndromes. Consequently a formidable PTSD literature has emerged since the late 1970s. Included among the wealth of research and clinical papers are a variety of edited books containing contributions from the major authorities in the field e.g. Figley 1978, 1985, van der Kolk 1984, Kelly 1985, Sonnenberg, Blank, Milgram 1986, Ochberg 1988. However to date no publication has brought together and integrated the variety of theoretical and therapeutic perspectives in a form readily accessible to clinicians. It is to this gap in the literature that this contribution is addressed.

Post-Traumatic Stress Disorder J.F. Pagel, 2020-09-22. PTSD is in no way an easy diagnosis for

the patient the provider or the therapist It is a diagnosis developed at the border of our capacity to handle extreme stress a marker diagnosis denoting the limits of our capacity for functioning in the stress of this modern world For both individuals and society PTSD marks the limits of our available compassion and our capacity to protect ourselves from the dangers of the environment and other humans PTSD is often a chronic disease forming at a place where mind sometimes no longer equals the brain a point at which individual patient requirements often trump theory and belief There are treatments for PTSD that work and many that do not This book presents evidence rather than theory anecdote or case report Psychological approaches including prolonged exposure imagery rehearsal therapy and EMDR have a greater than 75% positive short term response when used to treat PTSD Yet these treatments vary markedly and have different even contradictory underlying theory and objectives for treatment Medications rarely indicated as primary therapy can be used to treat symptoms and address comorbid PTSD diagnoses Treatment of sleep apnea in the PTSD population produces a positive effect on symptoms and a reduction in morbidity and mortality across the span of life Complementary treatments offer the many individuals chronically affected by PTSD assistance in coping with symptoms and opportunities to attempt to functionally integrate their experience of trauma

medical surgical and psychiatric casualties of Operation Iraqi Freedom will receive care from a broad group of clinicians working in diverse clinical settings. Although most service members will initially be treated in military treatment facilities, many may find themselves returning to the United States with conditions that are treated in military facilities, VA Hospitals, civilian treatment centers, or all of these as they move through their recovery. As a result, some clinicians involved in treating casualties returning from Iraq may not have an understanding of the experiences of the military patient, the military system in which he or she serves, the military medical services available, or the potential impact of medical decisions on the service member's future military career. It is essential that all health care professionals, civilian or military, who care for casualties from Operation Iraqi Freedom have at least rudimentary and relevant military knowledge. A variety of factors, including personal and cultural characteristics, orientation toward coping with stressors and painful emotions, pre-deployment training, military related experiences, and postdeployment environment will shape responses to Operation Iraqi Freedom. Furthermore, psychological responses to deployment experiences can be expected to change over time. The absence of immediate symptoms following exposure to a traumatic event is not necessarily predictive of a long term positive adjustment. Depending on a variety of factors, veterans may appear to be functioning at a reasonable level immediately upon their return home, particularly given their relief at having survived the war zone and returned to family and friends. However, as life circumstances change, symptoms of distress may increase to a level worthy of clinical intervention. Even among those veterans who will need psychological services post-deployment, acute stress disorder and posttraumatic stress disorder (PTSD) represent only two of a myriad of psychological presentations that are likely. Veterans of Operation Iraqi Freedom are likely to have been exposed to a wide variety of war zone related stressors that can impact psychological functioning in a number of ways. It is important for clinicians to recognize that the skills and experience that they have developed in working with veterans with chronic PTSD will serve them well with service members returning from Iraq. Clinicians' experience in talking about trauma, educating patients and families about traumatic stress reactions, teaching skills of anxiety and anger management, facilitating mutual support among groups of veterans, and working with trauma related guilt will all be useful and applicable.
