**Transportation and Information** Piyushimita (Vonu) Thakuriah, D. Glenn Geers, 2013-06-18 Transformations in wireless connectivity and location aware technologies hold the promise of bringing a sea change in the way transportation information is generated and used in the future. Sensors in the transportation system when integrated with those in other sectors for example energy utility and health have the potential to foster novel new ways of improving livability and sustainability. The end result of these developments has been somewhat contradictory. Although automation in the transportation environment has become increasingly widespread, the level of involvement and active participation by people in terms of co creation and contribution of information has also increased. As a result, the following two major trends have been observed: 1. increases in Machine to Machine (M2M) communications and 2. increases in the variety and volume of User Generated Content. In this transportation paradigm, the pervasive use of Information and Communication Technologies will serve as the foundation for mobility intelligence towards an ubiquitous information centered mobility environment. However, many technical and operational questions as well as social management and legal challenges present themselves in the transformation to this vision. The book presents a non technical review of research and initiatives and a discussion of such opportunities and challenges.

**Framework for Crawling and Local Event Detection Using Twitter Data** Hrishikesh Bakshi, 2011 Twitter is a popular social media service with millions of registered users. As of December 2010, Twitter hosts substantial amounts of user contributed data of real world events. Twitter's core functions represent a simple social awareness stream model. Twitter users share information about upcoming events, the events they are attending, and events being broadcasted. The users also specify their location in their profile on Twitter. We can programmatically collect data from Twitter using their API and detect top terms and events in the data. Researchers can use this program to collect any kind of data from social networks easily. Journalists can get a real time list of events detected by this method. In this thesis, we propose a solution to tackle the problem above. We wrote scripts that collected Twitter data through Twitter API. The scripts collect data according to user location and by search keywords. We built a web interface that provides mechanism to manage the collection of data. The web interface allows addition of new locations and keywords to the data collection. We collected Twitter data for important locations across the United States of America and the world using these tools. We use two approaches to detect trends in the data. In the first approach, we detected spikes in data by looking at overall rate of tweets at each location over a period of time. In the second approach, we indexed the data according to location and time of the day. Then we identified trends in the indexed data by ranking the terms according to spikes in term frequency. Using our framework, we can detect the top events and trends for a given time period and location according to Twitter data.
