Evaluations of fragrances: Linalool, Phenylpropanol,  
Benzylaldehyde and Linalyl acetate

## Introduction

### Abstract

Individuals with olfactory dysfunction, i.e. ability to smell fragrances that are congenital or from aging, have been reported to be diagnosed with a number of non-olfactory conditions including depression, hypertension and heart disease. This work is the first to evaluate the olfactory perception of the common fragrance linalool, benzylaldehyde and linalyl acetate.

Three studies were carried out to evaluate olfactory perception using two methods: the panel method and the method of best choice. The panel method was chosen for the validation of the common olfactory perception of these substances and the method of best choice for the validation of the individual perception of these substances as olfactory stimuli. Fragrances linalool, benzylaldehyde and linalyl acetate. These three substances are often found in cosmetics and perfume products. In these products, these substances are known as fixatives and are added to stabilize other aromatic substances.

### Results

As can be seen, olfactory perception of linalool, benzylaldehyde and linalyl acetate is confirmed by olfactory perception of these substances. Results show that fragrance is a good olfactory perception of 80.00%.
