Cone Beam CT of the Head and Neck Chung H. Kau, Kenneth Abramovitch, Sherif Galal Kamel, Marko Bozic, 2010-11-19
Cone Beam CT of the Head and Neck presents normal anatomy of the head using photographs of cadavers and CBCT images in sagittal, axial and coronal planes with the anatomic structures and landmarks clearly labelled. Important structures and regions are presented in detailed view. The photographs of human tissue based on slicing of cadaveric heads combined with CBCT images have not been used previously for an atlas of anatomy. Scanned objects with the possibility of 3D reconstruction present better understanding of the anatomy.

High-precision Cone-beam CT Guidance of Head and Neck Surgery Nathaniel M. Hamming, 2009. Modern image guided surgery aids minimally invasive high precision procedures that increase efficacy of treatment. This thesis investigates two research aims to improve precision and integration of intraoperative cone beam CT (CBCT) imaging in guidance of head and neck H N surgery. First, marker configurations were examined to identify arrangements that minimize target registration error (TRE). Best arrangements minimized the distance between the configuration centroid and surgical target while maximizing marker separation. Configurations of few markers could minimize TRE with more markers providing improved uniformity. Second, an algorithm for automatic registration of image and world reference frames was pursued to streamline integration of CBCT with real time tracking and provide automatic updates per scan. Markers visible to the tracking and imaging systems are automatically co-localized and registered with equivalent accuracy and superior reproducibility compared to conventional registration. Such work helps the implementation of CBCT in H N surgery to maximize surgical precision and exploit intraoperative image guidance.

High-precision Cone-beam CT Guidance of Head and Neck Surgery Nathaniel Hamming, 2009

Sectional Anatomy of the Head and Neck John H. Lillie, Brent A. Bauer, 1994. This superb atlas of the sectional anatomy of the head and neck exclusive of the CNS is presented in two complementary planes, coronal and horizontal. Sixty four exceptional pen and ink illustrations accurately capture the fine detail of 3mm thick sections through the region. Every detail was exactly transferred from photographs of the section and its identification was confirmed by microdissection of the exposed surface. These pen and ink images have been reproduced at natural size in labeled and unlabeled pairs, an approach that allows the complete identification of structures without masking critical anatomical detail. The captions that accompany each set of illustrations provide brief authoritative information about the section and how it relates to adjacent tissues. Difficult concepts such as regional compartments and facial spaces are clearly explained reflecting the broad experience of the senior author in teaching the basic as well as the applied clinical anatomy of the head and neck. Twenty two sections have been selected for

radiographic imaging These high resolution radiographs portray planar detail at a level which closely simulates that revealed by high quality CT images of the region Introductory chapters review the history of sectional anatomy and provide a unique overview of the fundamental organization of the head and neck They enhance the value of an atlas that will guide the student and clinician through a sequential study of this anatomically intricate region and will aid radiologists in interpreting bony images and relating them to the soft tissues which surround them
