

**SECTION E:** Big data refers to huge collections of data that are difficult to process, analyze, and manage using conventional data tools. It is a core component of the  platform, which also includes cloud computing,  devices, and social networking. The five Vs of big data are high volume, high , diversified variety, unknown veracity, and low- value. Although SQL and relational databases can be used for big datasets, a collection of alternative tools referred to as  has become popular. These tools work well when databases scale  (horizontally) and when databases are broken into subsets called . Modern database tools also handle

scaling as devices are added when additional capacity is required. NoSQL tools are sometimes said to create  databases, but they usually have some type of structure, though it may be more flexible than the relational model. A key- data model provides each data element with a key. A(n) -oriented data model makes it easy to access data stored in similar fields, rather than in individual records. Two very popular NoSQL tools include , which is a big data file system, and , which sends processing logic to the data, rather than bringing the data to the computer that performs the processing.

**Elgar Encyclopedia of Technology and Politics** Ceron, Andrea,2022-10-11 The Elgar Encyclopedia of Technology and Politics is a landmark resource that offers a comprehensive overview of the ways in which technological development is reshaping politics Providing an unparalleled starting point for research it addresses all the major contemporary aspects of the field comprising entries written by over 90 scholars from 33 different countries on 5 continents *Resources in Education* ,1997-10 **Energy Abstracts for Policy Analysis** ,1984 **Merging Symbolic and Data-Driven AI for Robot Autonomy** Nikos Katzouris,Simona Perri,Mohan Sridharan ,Daniele Meli,2025-09-08 Robots are increasingly being deployed to assist and collaborate with humans in many applications such as medicine navigation and industrial automation To truly collaborate with humans in complex environments robots require advanced cognitive capabilities including the ability to reason with domain specific commonsense knowledge and the noise observations obtained in the presence of partial observability and non deterministic action outcomes Research in Artificial Intelligence AI has resulted in sophisticated symbolic formalisms that use temporal and logic relations to represent commonsense domain knowledge as well as probabilistic data driven frameworks that quantitatively represent uncertainty in the decision making process of robot systems Stand alone symbolic or stochastic AI methods have limitations when applied to robots in complex scenarios

Symbolic AI methods reason with relational descriptions of the attributes of the domain and the robot to guide the robot's behavior. It is however often computationally intractable to use these methods to reason about uncertainty quantitatively or to operate at the level of granularity required for precise interaction with objects in complex domains. Probabilistic and data-driven AI methods on the other hand elegantly represent uncertainty quantitatively and provide mechanisms for reasoning and acting at the level of granularity required for interaction with the physical worlds. These methods however offer limited expressiveness for complex cognitive concepts.
