## **Concepts And Values In Biodiversity Routledge Studies In Biodiversity Politics And Management:**

*Concepts and Values in Biodiversity* Dirk Lanzerath, Minou Friese, 2014-01-23 Biodiversity may refer to the diversity of genes species or ecosystems in general. These varying concepts of biodiversity occasionally lead to conflicts among researchers and policy makers as each of them require a customized type of protection strategy. This book addresses the questions surrounding the merits of conserving an existing situation evolutionary development or the intentional substitution of one genome species or ecosystem for another. Any practical steps towards the protection of biodiversity demand a definition of that which is to be protected and in turn the motivations for protecting biodiversity. Is biodiversity a necessary model which is also useful or does it carry intrinsic value? Debates like this are particularly complex when interested parties address it from different conceptual and moral perspectives. Comprised of three parts each complemented by a short introductory paragraph this collection presents a variety of approaches to this challenge. The chapters cover the perspectives of environmental scientists with expertise in evolutionary environmental biology systematic zoology and botany as well as those of researchers with expertise in philosophy ethics politics law and economics. This combination facilitates a truly interdisciplinary debate by highlighting hitherto unacknowledged implications that inform current academic and political debates on biodiversity and its protection. The book should be of interest to students and researchers of environment studies biodiversity environmental philosophy ethics and management.

*Mountains Climate and Biodiversity* Carina Hoorn, Allison Perrigo, Alexandre Antonelli, 2018-02-22 Mountains Climate and Biodiversity A comprehensive and up to date synthesis for students and researchers. Mountains are topographically complex formations that play a fundamental role in regional and continental scale climates. They are also cradles to all major river systems and home to unique and often highly biodiverse and threatened ecosystems. But how do all these processes tie together to form the patterns of diversity we see today? Written by leading researchers in the fields of geology biology climate and geography this book explores the relationship between mountain building and climate change and how these processes shape biodiversity through time and space. In the first two sections you will learn about the processes theory and methods connecting mountain building and biodiversity. In the third section you will read compelling examples from around the world exploring the links between mountains climate and biodiversity. Throughout the 31 peer reviewed chapters a non technical style and synthetic illustrations make this book accessible to a wide audience. A comprehensive glossary summarises the main concepts and terminology. Readership Mountains Climate and Biodiversity is intended for students and researchers in geosciences biology and geography. It is specifically compiled for those who are interested in historical biogeography biodiversity and conservation.

**Vegetation and Climate**

Siegmar-W. Breckle, M. Daud Rafiqpoor, 2022-11-07

Vegetation soil and climate are the most important components of ecological systems. The book represents a compact synthesis of our current knowledge about the ecology of the Earth and is thus the basis for understanding the major interrelationships in a global perspective. In the first part with a rich endowment of illustrations and photographic material the well introduced book deals with the essential processes and operations on the Earth's surface that lead to the formation of the vegetation cover with its distinctive zonation. In the second part the individual vegetation zones as large scale ecosystems i.e. zonobiomes of the biosphere are consistently described comparatively according to certain criteria. In a short and compact form the main characteristics and structures as well as examples of ecosystem processes are discussed. The large scale ecosystems are at the same time the basis and reference system for all anthropogenic changes that have drastically altered the vegetation in the last millennia but especially in the 20th century. This book is a translation of the original German 1st edition *Vegetation und Klima* by Siegmar W Breckle and M Daud Rafiqpoor published by Springer Verlag GmbH Germany part of Springer Nature in 2019. The translation was done with the help of artificial intelligence machine translation by the service DeepL.com. A subsequent human revision was done primarily in terms of content so that the book will read stylistically differently from a conventional translation. Springer Nature works continuously to further the development of tools for the production of books and on the related technologies to support the authors.

**Indigenous Knowledge & Development Monitor** ,1993    Ethics in Biodiversity Conservation Patrik Baard,2021-11-28 This book examines the role of ethics and philosophy in biodiversity conservation The objective of this book is two fold on the one hand it offers a detailed and systematic account of central normative concepts often used but rarely explicated nor justified within conservation biology Such concepts include values both intrinsic instrumental and more recently relational rights and duties The second objective is to emphasize to environmental philosophers and applied ethicists the many interesting decision making challenges of biodiversity conservation The book argues that a nuanced account of instrumental values provides a powerful tool for reasoning about the values of biodiversity It also scrutinizes relational values the concept of rights of nature and risk and show how moral philosophy proves indispensable for these concepts Consequently it engages with recent suggestions on normative aspects of biodiversity conservation and show the need for moral philosophy in biodiversity conservation The overriding aim of this book is to provide conservation biologists and policy makers with a systematic overview of concepts and assessments of the reasons for reaching prescriptive conclusions about biodiversity conservation This will prove instrumental in clarifying the role of applied ethics and a refined understanding of the tools it can provide This title will be of interest to students and scholars of conservation biology conservation policy environmental ethics and environmental philosophy
