Sheng S. Li, 2012-12-06 The purpose of this book is to provide the reader with a self contained treatment of fundamental solid state and semiconductor device physics. The material presented in the text is based upon the lecture notes of a one year graduate course sequence taught by this author for many years in the Department of Electrical Engineering of the University of Florida. It is intended as an introductory textbook for graduate students in electrical engineering. However many students from other disciplines and backgrounds such as chemical engineering, materials science and physics have also taken this course sequence and will be interested in the material presented herein. This book may also serve as a general reference for device engineers in the semiconductor industry. The present volume covers a wide variety of topics on basic solid state physics and physical principles of various semiconductor devices. The main subjects covered include crystal structures, lattice dynamics, semiconductor statistics, energy band theory, excess carrier phenomena and recombination mechanisms, carrier transport and scattering mechanisms, optical properties, photoelectric effects, metal semiconductor devices, the p-n junction diode, bipolar junction transistor, MOS devices, photonic devices, quantum effect devices and high speed III-V semiconductor devices. The text presents a unified and balanced treatment of the physics of semiconductor materials and devices. It is intended to provide physicists and materials scientists with more device backgrounds and device engineers with a broader knowledge of fundamental solid state physics.

**A Direct-translation Reading Aid for the Blind** John G. Linvill, James Charles Bliss, 1965     Ultrashort Laser Pulses and Applications Wolfgang Kaiser, 2013-03-14

Ten years ago Stanley L. Shapiro edited the book entitled *Ultrashort Light Pulses* Topics Appl Phys Vol 18 which was written by eight experts in the field. Six years later Charles V. Shank added a bibliography 1980-1983 in the second edition with approximately one thousand new references. During the past decade the field has grown so rapidly that a completely new book had to be written. In particular, the reduction of the time scale of light pulses into the femtosecond range has opened up new experimental possibilities never even foreseen in the preceding literature. The vast literature with countless ideas and applications makes it impossible for a single person to write a comprehensive review. Nine scientists actively working in the field since its beginning have decided to join forces to prepare a new book describing the present state of the art. Emphasis is placed on the generation and numerous applications of ultrashort laser pulses. This book covers a wide area of science, physics, engineering, chemistry and biology. The various chapters and sections are prepared in each case such that the reader is given a brief introduction to the specific subject. Ample references for a more detailed study are given at the end of each chapter.

*Microelectronics Technology and Devices - SBMicro 2009* Davies William de Lima Monteiro, Olivier Bonnaud, Nilton Itiro Morimoto, 2009-08 This issue of ECS Transactions features eight invited and sixty seven regular papers on technology.

devices systems optoelectronics modeling and characterization all either directly or indirectly related to microelectronics The topics presented herein reveal the multidisciplinary character of this field which definitely incites the highly cooperative trace of human nature **Radio Engineering and Electronic Physics** ,1961 **Ultrashort Laser Pulses** Wolfgang Kaiser,2006-11-14

This second edition in paperback provides an up to date review of the state of the art in different generation processes for ultrashort laser pulses Inaddition extensive applications in a wide range of fields in physics engineering chemistry and biology are discussed Eight chapters dealwith the following topics the generation of picosecond and femtosecond laser pulses nonlinear wave interactions new investigations in solid state physics recent progress in optoelectronics advances in coherent material excitations ultrafast vibrational lifetimes and energy redistribution in liquids new observations of chemical reactions in the liquid state the primary processes of important biological systems The book is essential reading for scientists and engineers who want to know what is going on in this rapidly advancing field It should also interest graduate students and others who seek an introduction to laserpulses
