Control Systems and Mathematical Methods in Economics Gustav Feichtinger, Raimund M. Kovacevic, Gernot Tragler, 2018-06-08 Since the days of Lev Pontryagin and his associates the discipline of Optimal Control has enjoyed a tremendous upswing not only in terms of its mathematical foundations but also with regard to numerous fields of application which have given rise to highly active research areas Few scholars however have been able to make contributions to both the mathematical developments and the socio economic applications Vladimir Veliov is one of them In the course of his scientific career he has contributed highly influential research on mathematical aspects of Optimal Control Theory as well as applications in Economics and Operations Research One of the hallmarks of his research is its impressive breadth This volume published on the occasion of his 65th birthday accurately reflects that diversity The mathematical aspects covered include stability theory for difference inclusions metric regularity generalized duality theory the Bolza problem from a functional analytic perspective and fractional calculus In turn the book explores various applications of control theory such as population dynamics population economics epidemiology optimal growth theory resource and energy economics environmental management and climate change Further topics include optimal liquidity dynamics of the firm and wealth inequality

System Identification (SYSID '03) Paul Van Den Hof, Bo Wahlberg, Siep Weiland, 2004-06-29 The scope of the symposium covers all major aspects of system identification experimental modelling

signal processing and adaptive control ranging from theoretical methodological and scientific developments to a large variety of engineering application areas. It is the intention of the organizers to promote SYSID 2003 as a meeting place where scientists and engineers from several research communities can meet to discuss issues related to these areas. Relevant topics for the symposium program include: Identification of linear and multivariable systems; identification of nonlinear systems including neural networks; identification of hybrid and distributed systems; Identification for control; experimental modelling in process control; vibration and modal analysis; model validation; monitoring and fault detection; signal processing and communication; parameter estimation and inverse modelling; statistical analysis and uncertainty bounding; adaptive control and data based controller tuning; learning; data mining and Bayesian approaches; sequential Monte Carlo methods including particle filtering; applications in process control systems; motion control systems; robotics; aerospace systems; bioengineering and medical systems; physical measurement systems; automotive systems; econometrics; transportation and communication systems. Provides the latest research on System Identification. Contains contributions written by experts in the field. Part of the IFAC Proceedings Series which provides a comprehensive overview of the major topics in control engineering.

Networked Nonlinear Stochastic Time-Varying Systems Hongli Dong, Zidong Wang, Nan Hou, 2021-09-09. Networked Nonlinear Stochastic Time Varying Systems Analysis and Synthesis copes with the filter design, fault estimation and reliable control problems for different classes of nonlinear stochastic time varying systems with network enhanced complexities. Divided into three parts, the book discusses the finite horizon filtering, fault estimation and reliable control and randomly occurring nonlinearities, uncertainties followed by designing of distributed state and fault estimators and distributed filters. The third part includes problems of variance constrained H state estimation, partial nodes based state estimation and recursive filtering for nonlinear time varying complex networks with randomly varying topologies and random coupling strengths. Offers a comprehensive treatment of the topics related to Networked Nonlinear Stochastic Time Varying Systems with rigorous math foundation and derivation. Unifies existing and emerging concepts concerning control, filtering, estimation and distributed filtering. Provides a series of latest results by drawing on the conventional theories of systems science, control engineering and signal processing. Deal with practical engineering problems such as event triggered H filtering, non fragile distributed estimation, recursive filtering, set membership filtering. Demonstrates illustrative examples in each chapter to verify the correctness of the proposed results. This book is aimed at engineers, mathematicians, scientists and upper level students in the fields of control engineering, signal processing, networked control systems, robotics, data analysis and automation.

Saturated Control of Linear Systems Abdellah Benzaouia, Fouad Mesquine, Mohamed Benhayoun, 2017-09-20. This book deals with a combination of two main problems for the first time. They are saturation on control and on the rate or increment of the control and the solution of unsymmetrical saturation on the control by LMIs. It treats linear systems in state space form in both the continuous and discrete time domains. Necessary and sufficient conditions are derived for autonomous

linear systems with constrained state increment or rate such that the system evolves respecting incremental or rate constraints if any A pole assignment technique is then used to solve the problem giving stabilizing state feedback controllers that respect non symmetrical constraints on control alone or on both control and its increment or rate Illustrative examples show the application of these methods on academic examples or on such real plant models as the double integrator system This problem is then extended to various others including systems with constraints and perturbations singular systems with constrained control systems with unsymmetrical saturations saturated systems with delay and 2 D systems with saturations The solutions obtained are of two types necessary and sufficient conditions solved with linear programming techniques and sufficient conditions under LMIs A new approach extends existing techniques for dealing with symmetrical saturations to take direct account of unsymmetrical saturations into account with LMIs This tool enables the authors to obtain new results on continuous and discrete time systems The book uses illustrative examples and figures and provides many comparisons with existing results Systems theoreticians interested in multidimensional systems and practitioners working with saturated and constrained controllers will find the research and background presented in Saturated Control of Linear Systems to be of considerable interest in helping them overcome problems with their plant and in stimulating further research

Constrained Estimation and Approximation Using Control, Optimization, and Spline Theory Teresa M. Lebaire, 2016 There has been an increasing interest in shape constrained estimation and approximation in the fields of applied mathematics and statistics Applications from various areas of research such as biology engineering and economics have fueled this soaring attention Due to the natural constrained optimization and optimal control formulations achieved by inequality constrained estimation problems optimization and optimal control play an invaluable part in resolving computational and statistical performance matters in shape constrained estimation Additionally the favorable statistical numerical and analytical properties of spline functions grant splines an influential place in resolving these issues Hence the purpose of this research is to develop numerical and analytical techniques for general shape constrained estimation problems using optimization optimal control spline theory and statistical tools A number of topics in shape constrained estimation are examined **Proceedings of the 1989 American Control Conference**, 1989 SIAM Journal on Control and Optimization Society for Industrial and Applied Mathematics, 2009, 1997 **Advances in Intelligent and Autonomous Aerospace Systems** John Valasek, 2012 Research advances in embedded computational intelligence communication control and new mechanisms for sensing actuation and adaptation hold the promise to transform aerospace The result will be air and space vehicles propulsion systems exploration systems and vehicle management systems that respond more quickly provide large scale distributed coordination work in dangerous or inaccessible environments and augment human capabilities Advances in Intelligent and Autonomous Aerospace Systems seeks to provide both the aerospace researcher and the practicing aerospace engineer with an exposition on the latest innovative methods and approaches that focus on intelligent and autonomous

aerospace systems The chapters are written by leading researchers in this field and include ideas directions and recent results on intelligent aerospace research issues with a focus on dynamics and control systems engineering and aerospace design The content on uncertainties modeling of large and highly non linear complex systems robustness and adaptivity is intended to be useful in both the sub system and the overall system level design and analysis of various aerospace vehicles A broad spectrum of methods and approaches are presented including Bio Inspiration Fuzzy Logic Genetic Algorithms Q Learning Markov Decision Processes Approximate Dynamic Programming Artificial Neural Networks Probabilistic Maps Multi Agent Systems Kalman particle and confidence filtering
