

Transformations lab report: (adapted from the "Carolina" lab sheets)

1. "What is the purpose of plating the + and - cells on the 1st plate?"

The purpose of having one with the plasmid and one without the plasmid is to check there is no selection when the cells are mixed randomly since that having the plasmid should not have any effect on the growth of the colony bacteria.

2. "What is the purpose of plating the + and - cells on the 2nd (amp) plate?"

The purpose of having a selected one on that plate and not the other one shows that colony bacteria (amp^r genes) that bacteria produced the amp^r plasmid cell grows. This is because the amp^r is going to kill all the bacteria with them with the growth because it will still be gone, but the amp^r is therefore not gone.

3. "What does your final transformation have been successful and the phenotype on the original cell?"

The way that I tell now that the transformation has been successful is what there is they have colonies, therefore, more growth, and now when the colonies are formed.

4. "What one plate would you first report to conclude that the transformation occurred successfully? Why?"

The one plate I would report to conclude that transformation would be the plate with the plasmid and the amp^r because it has the plasmid which is the subject of transformation and then the antibiotic is what is going to everything else following into the transformation.

5. "Is a transformation efficiency calculation using [this](#) [and](#) [this](#)?
