Demography Ivanka Russell, 2025 Population Measurement Discuss methods for measuring population size density and distribution using census data surveys and demographic indicators providing a foundation for demographic analysis Vital Statistics Explore the collection and analysis of vital statistics including birth rates death rates marriage rates and migration rates which are crucial for understanding population dynamics and trends Population Growth Models Examine models for forecasting population growth such as the exponential growth model logistic growth model and cohort component model to predict future population changes and dynamics Age Structure Analysis Address the importance of analyzing age distribution within a population including the construction and interpretation of population pyramids to understand demographic transitions and aging trends Demographic Transition Theory Examine the stages of demographic transition theory which describes changes in birth and death rates associated with economic development and modernization and its impact on population growth and structure Statistical Techniques Highlight the use of statistical techniques and software for demographic analysis including regression analysis survival analysis and demographic modeling to interpret population data and inform policy decisions Demography Samuel H. Preston, 2001 Model-Based Demography Thomas K. Burch, 2017-10-14 Late in a career of more than sixty years Thomas Burch an internationally known social demographer undertook a wide ranging methodological critique of demography This open access volume contains a selection of resulting papers some previously unpublished some published but not readily accessible from past meetings of The International Union for the Scientific Study of Population and its research committees or from other small conferences and seminars Rejecting the idea that demography is simply a branch of applied statistics his work views it as an autonomous and complete scientific discipline When viewed from the perspective of modern philosophy of science specifically the semantic or model based school demography is a balanced discipline with a rich body of techniques and data but also with more and better theories than generally recognized As demonstrated in this book some demographic techniques can also be seen as theoretical models and some substantive behavioral models commonly rejected as theory because of inconsistent observations are now seen as valuable theoretical models for example demographic transition theory This book shows how demography can build a strong theoretical edifice on its broad and deep empirical foundation by adoption of the model based approach to science But the full fruits of this approach will require demographers to make greater use of computer modeling both macro and micro simulation in the statement and manipulation of theoretical ideas as well as for numerical computation This book is open

Age-Structured Population Dynamics in Demography and Epidemiology Hisashi

Inaba, 2017-03-15 This book is the first one in which basic demographic models are rigorously formulated by using modern age structured population dynamics extended to study real world population problems Age structure is a crucial factor in understanding population phenomena and the essential ideas in demography and epidemiology cannot be understood without mathematical formulation therefore this book gives readers a robust mathematical introduction to human population studies In the first part of the volume classical demographic models such as the stable population model and its linear extensions density dependent nonlinear models and pair formation models are formulated by the McKendrick partial differential equation and are analyzed from a dynamical system point of view In the second part mathematical models for infectious diseases spreading at the population level are examined by using nonlinear differential equations and a renewal equation Since an epidemic can be seen as a nonlinear renewal process of an infected population this book will provide a natural unification point of view for demography and epidemiology The well known epidemic threshold principle is formulated by the basic reproduction number which is also a most important key index in demography The author develops a universal theory of the basic reproduction number in heterogeneous environments By introducing the host age structure epidemic models are developed into more realistic demographic formulations which are essentially needed to attack urgent epidemiological control problems in the real world

Handbook of Population Dudley L. Poston, Michael Micklin, 2006-04-26 This

Point Processes for Reliability Analysis Ji Hwan Cha, Maxim

Finkelstein, 2018-01-17 Focusing on the theory and applications of point processes Point Processes for Reliability Analysis naturally combines classical results on the basic and advanced properties of point processes with recent theoretical findings of the authors It also presents numerous examples that illustrate how general results and approaches are applied to stochastic description of repairable systems and systems operating in a random environment modelled by shock processes The real life objects are operating in a changing random environment One of the ways to model an impact of this environment is via the external shocks occurring in accordance with some stochastic point processes The Poisson homogeneous and nonhomogeneous process the renewal process and their generalizations are considered as models for external shocks affecting an operating system At the same time these processes model the consecutive failure repair times of repairable engineering systems Perfect minimal and intermediate imperfect repairs are discussed in this respect Covering

material previously available only in the journal literature Point Processes for Reliability Analysis provides a survey of recent developments in this area which will be invaluable to researchers and advanced students in reliability engineering and applied mathematics

INDEPTH Model Life Tables for Sub-Saharan Africa, 2004 Model life tables provide ways of deriving accurate mortality schedules or predicting future trends from scanty data In settings where accurate data are unavailable these provide invaluable tools for estimating mortality conditions among populations Constructing model life tables requires the availability of accurate empirical life tables that depict the different

patterns of age specific risks of death in the populations covered Starting in the early 1960s a number of field based research stations were established to collect longitudinal data on births deaths and migrations covering some geographic areas in sub Saharan Africa and Asia In the late 1990s these research sites teamed up to form an international network INDEPTH This book presents model life tables for Africa using accurate empirical data from 19 INDEPTH demographic surveillance system sites throughout sub Saharan Africa A modified Brass logic system is used to produce mortality models that are unique in that they incorporate for the first time empirical and accurate data representing prevailing mortality patterns in sub Saharan Africa taking into account the effect of the HIV AIDS epidemic
