

**Fig. 3.** Deployment sequence of NASA's STAC-BEAM geometry model.

The team aims to define a morphological design method that can generate deployable structures based on crystallographic symmetry and on variants of three NASA structures, the PACTRUSS, the X-BEAM and the STAC-BEAM. The latter two are used as extendable support structures for platforms such as solar concentrators and phased arrays. In order to define their structural morphology the team develops a four-letter notation (t, b, v, d) that corresponds to the four structural component groups of a cubic cell. The first letter (t) corresponds to the top horizontal members, the second (b) to the bottom horizontal members, the third (v) to the vertical members and the fourth (d) to the diagonal members.

The notation then describes whether the member is rigid (r) or hinged (h). The morphological notation for the PACTRUSS seen in figure 1 is (h, h, r, h) (representing hinged top members, hinged bottom members, rigid vertical members and hinged diagonal members).

**Origami8, Volume I** Guoxing Lu, Zhong You, Michael Assis, 2026-01-01 These four volumes of proceedings contain 126 papers contributed to the 8th International Meeting on Origami Science Mathematics and Education 8OSME held on 16-18 July 2024 at Swinburne University of Technology in Melbourne Australia. The papers represent current work in different disciplines of origami and they are grouped into four subject themes: Volume 1 Engineering I, Volume 2 Engineering II, Volume 3 Mathematics Computation History and Mental Health, and Volume 4 Design and Education. We witness increasing interests in origami from researchers, practitioners, and artists. Of a special note is the rapidly growing research in origami engineering, a distinctive field with fundamental concepts and applications related to space, mechanical, material, medical, and structural engineering, etc. Participants of 8OSME should find great passion and opportunity of collaborations across disciplines of origami. We hope these four volumes will inspire not just currently active researchers and artists but also the next generation of origami scientists, mathematicians, engineers, designers, historians, and teachers. **Handbook of Research on Methodologies for Design and Production Practices in Interior Architecture** Garip, Ervin, Garip, S. Banu, 2020-11-20 Studio environments can be defined as multi-dimensional integrated production spaces where basic design trainings take place and where design issues including theoretical notions such as sociological, political, phenomenological, and other dimensions are discussed. Present approaches within the literature and social media on this topic give cause for students to evaluate their future professions over finished and pictorial products rather than ontological and processual means. While there are many resources available on the present approaches of aesthetics and visuality of interior spaces, there is not much research available on new design methodologies related to design processes and new applied methods in interior architecture. Based on different contexts, these methods of design practice have the potential to enrich design processes and create multiple discussion platforms within project studios as well as other design media. These different representations and narration methods for research in the context of interior architecture can be effectively used in design processes. The *Handbook of Research on Methodologies for Design and Production Practices in Interior Architecture* proposes new design methodologies and related design processes and introduces new applied method approaches while presenting alternative methods that have been used within design studios in the field of interior architecture. The chapters deal with four major sections: the design process and interdisciplinary approaches, then scenario development and content, followed by material texture and atmosphere, and concluding with new approaches to design. While highlighting topics such as spatial perception, design strategies, architectural atmosphere, and design thinking, this book is of interest to architects, interior designers, practitioners, stakeholders, researchers, academicians, and students looking for advanced research on the new design methodologies and processes for interior architecture.

### **Deployable Structures**

Carlos Henrique Hernández Merchan, 1987 This thesis has the purpose of describing the meaning and applications of deployable structures making emphasis in the scissor hinged and sliding mechanisms and the development of new geometries details and mechanisms that make these systems buildable and useful for architectural applications A deployable structure is one that can be transformed with the addition of an energy input from a closed stage or compact configuration to a predetermined stable expanded form Deployable structures are suitable in response to the following needs a A situation in which there is a need to create enclosed or protected space for a short period of time and then move that space to another location for erection or storage b Difficult access places and or lack of labor c Special applications equipment and shelters for special equipment which can not be transported in full open size and needs to be erected in a very quick way d Need to enclose space due to variable weather conditions e Situations of high risk with elevated labor costs hostile environments costly transportation f Construction aid g As a construction method There are many mechanisms which fall into the category of deployable structures but we can group them into two general categories A Struts Structures scissor hinged tensile and sliding mechanisms etc B Surface Structures folded inflatable telescopic etc The general characteristic of group A is that these structures are made out of struts which commonly work as compression tension or bending components connected by joints or hinges In Group B stresses are carried by surfaces In some cases a continuous surface carries only tension forces like in pressurized or inflatable construction other structures are made out of small surfaces or planes joined together by some usually flexible means of forming a continuous structure Deployability implies an extra cost over an assembly structure due to more sophisticated expensive movable connections locking mechanisms and deployment mechanisms This extra cost has to be balanced by the structure s greater potential for adaptability mobility and labor saving construction
