

1) How does the fact that less than 75% of children are being vaccinated impact herd immunity?

Best answer: Herd immunity will decrease and the pathogen may be able to spread throughout the population more effectively with less than 75% being resistant.

2) Many posts on Facebook stated that the outbreak of whooping cough was due to the vaccine itself. Knowing that the whooping cough vaccine (pertussis) is an inactivated subunit vaccine, explain how this is or is not possible.

Best answer: It is not possible because inactivated subunit vaccines are not live or attenuated pathogens that could potentially cause a disease, which makes them safe to the general public.

Case study 2 follow-up question:

How does this impact contact immunity?

- ☐ Contact immunity will be greatly impacted because the total number in the population that are resistant has decreased.
- ☐ Since the vaccine is an inactivated vaccine, contact immunity will not be impacted because it is associated with attenuated vaccines.
- ☐ The vaccine is inactive and will cause there to be a decrease in contact immunity among immunocompromised patients.
- ☐ The vaccine is a whole unit vaccine which will cause more people in the population to gain resistance via contact immunity.
- ☐ Cannot determine with information provided.
