Resilient Operation of Distribution Grids with Distributed-Hierarchical Architecture Elisabeth Drayer, 2018-11-20 This thesis is about the design and the implementation of a resilient grid operation for the distribution grid This research question is induced by the advancing of three trends Decarbonisation decentralisation and digitalisation These three trends transform the hitherto passive distribution grid into an active system that contains an active operation The term resilience describes capabilities of the system to absorb to adapt and to recover from faults and disturbances This concept is realised on the one hand with the choice of the operation architecture on the other hand for the choice of possible methods and functions This thesis develops a distributed hierarchical operation architecture For this architecture several methods have been developed that optimally benefit from the operation architecture and that allow the fully automated operation of the distribution grid For that purpose a heuristic optimisation has been developed to solve problems like voltage profile violations and congestions Another important method especially with regard to resilience is the self healing capability to resupply clients after permanent faults

Communication and Security in Cyber-physical Systems Mohammad Javad Khojasteh, 2019 Recent technological advances in networking communication and computation technologies have enabled the development of cyber physical systems and cloud robotics where computing communication and control are tightly coupled and integrated into a single distributed platform These systems open the door to a myriad of new and exciting applications in transportation

health care agriculture energy and many others The need for the tight integration of different components requirements and time scales means that the modeling analysis and design of these systems present new challenges We focus on two aspects of emerging systems architecture Firstly we investigate the presence of finite rate digital communication channels with delays in the feedback loop In this context we study event triggering strategies that utilize timing information by transmitting in a state dependent fashion The proposed event triggering strategies utilize the available communication resources more efficiently compared to existed time triggering setups Secondly the distributed nature of cyber physical systems and cloud robotics is their Achilles heel as it is a source of vulnerability to cyber attacks In this regard we introduce the problem of learning based attacks in these systems and we show how the controller can impede these attacks by superimposing a carefully crafted privacy enhancing signal upon its control policy

A Secured Architecture for Mitigating Distributed Denial of Service Attack Integrating Internet of Things and Cloud Computing Helen Parimala,2023-01-09 Doctoral Thesis Dissertation from the year 2019 in the subject Computer Science IT Security grade 87 % Bharathidasan University language English abstract Internet of Things IoT and Cloud Computing play a vital role in the field of Information Technology The goal of IoT is to link objects of heterogeneous in nature to avail smart services and application anywhere anytime using any device Cloud Computing allows computer users to conveniently rent access to fully featured applications to software development and deployment environments and to computing infrastructure assets such as network accessible data storage and processing with its salient features of on demand self service broad network access resource pooling rapid elasticity and measured service Though the Cloud and IoT have emerged as

independent technology merging these two technologies brings renaissance in the field of future networks and in building smart environment This new evolution is known as CloudIoT One of the important challenges in CloudIoT is security Challenges on the integration of the Cloud within IoT are to be a major bottleneck The integration of security mechanism and data privacy are also a major concern Any leakage of information from any of the CloudIoT could severely damage the privacy and authenticity of the users and data Researchers all over the world put on efforts in integrating smart CloudIoT services to satisfy the needs of the CloudIoT Users But no prominent architecture has been authenticated so far Hence it is imperative to design architecture to integrate CloudIoT smart services and applications to access smart services in a secured manner at anywhere anytime The major challenges in implementing this scenario are security factors such as authenticity confidentiality integrity and privacy In network security there are several types of attacks which can harm the network resources and services Distributed Denial of Service DDoS is one of the malicious attacks which can harm data communication in CoT potentially There is a problem that may render customers to withdraw from the cloud services A traditional DDoS attack aims at servers and or the bandwidth of a network or a website in order to make them unavailable to their intended users However attackers can generate DDoS attack to harm the cloud resources in the same way as the cloud has a huge pool of resources which are larger than attackers resources Communications Architectures & Protocols ,1983
