Leong, 2003 The rapid acceptance of immunohistochemistry as an important and even indispensable adjunct to morphological examination and diagnosis requires the modern anatomical pathology laboratory to be conversant with and proficient in immunostaining procedures as well as methods of tissue processing and antigen retrieval and the underlying characteristics of the increasing number of antibodies and antisera available. This fully revised expanded and updated edition provides a comprehensive list of antisera and monoclonal antibodies that have useful diagnostic applications in tissue sections and cell preparations. Various clones which are commercially available to detect the same antigen are listed and the sensitivities and specificities of the antibodies are discussed. Techniques in Cell Cycle Analysis

Joe W. Gray,Zbigniew Darzynkiewicz,2008-02-24 Quantification of the proliferative characteristics of normal and malignant cells has been of interest to oncologists and cancer biologists for almost three decades This interest stems from the fact that cancer is a disease of uncontrolled proliferation b the finding that many of the commonly used anticancer agents are preferentially toxic to cells that are actively proliferating and c the observation that significant differences in proliferation characteristics exist between normal and malignant cells Initially cell cycle analysis was pursued enthusiastically in the hope of generating information useful for the development of rational cancer therapy strategies for example by allowing identification of rapidly proliferating tumors against which cell cycle specific agents could be used with maximum effectiveness and by allowing rational scheduling of cell cycle specific therapeutic agents to maximize the therapeutic ratio Unfortunately several difficulties have prevented realization of the early promise of cell cycle analysis Proliferative patterns of the normal and malignant tissues have been found to be substantially more complex than originally anticipated and synchronization of human tumors has proved remarkably difficult Human tumors of the same type have proved highly variable and the cytokinetic tools available for cell cycle analysis have been labor intensive as well as somewhat subjective and in many cases inapplicable to humans However the potential for substantially improved cancer therapy remains if more accurate cytokinetic information about human malignancies and normal tissues can be obtained in a timely fashion
