

TORQUE CONVERTER

RELEASE

When the torque converter clutch is released, fluid is fed into the torque converter by the pump into the release fluid passage. The release fluid passage is located between the oil pump drive shaft (227) and the turbine shaft (518). Fluid travels between the shafts and enters the release side of the pressure plate at the end of the turbine shaft. The pressure plate is forced away from the converter cover and allows the torque converter turbine to rotate at speeds other than engine speed.

The release fluid then flows between the friction element on the pressure plate and the converter cover to enter the apply side of the torque converter. The fluid then exits the torque converter through the apply passage which goes into the drive sprocket support (522) and on through an oil sleeve within the turbine shaft. This fluid now travels to the valve body and on to the oil cooler.

No TCC apply can be caused by:

- TCC PWM solenoid valve assembly (334) malfunction
- TCC control valve (335) stuck or binding
- TCC regulator apply valve (327) stuck or binding
- # 10 ball check valve (372) missing or mislocated
- Spacer plate and gaskets misaligned or incorrect
- TCC blowoff ball valve (420B) or spring (418) damaged or not seating
- Turbine shaft and/or seals damaged or missing
- Turbine shaft bearing (523) worn or damaged
- Pressure plate assembly friction material worn or damaged

TCC RELEASE

APPLY

When the PCM determines that the vehicle is at the proper speed for the torque converter clutch to apply it sends a signal to the TCC PWM solenoid. The TCC PWM solenoid then routes line fluid from the pump to the apply passage of the torque converter. The apply passage is a hole between two seals on the turbine shaft. The fluid flows inside the turbine shaft within an oil sleeve, then out of the sleeve and into the converter hub/drive sprocket support. Fluid passes through a hole in the support and into the torque converter on the apply side of the pressure plate assembly. Release fluid is then routed out of the torque converter between the turbine shaft and the pump shaft.

Apply fluid pressure forces the pressure plate against the torque converter cover to provide a mechanical link between the engine and the turbine. In vehicles equipped with the the Electronically Controlled Clutch Capacity (ECCC) system, the pressure plate does not fully lock to the torque converter cover. It is instead precisely controlled to maintain a small amount of slippage between the engine and the turbine, reducing driveline torsional disturbances.

The TCC apply should occur in fourth gear (also third gear in some applications), and should not apply until the transaxle fluid has reached a minimum operating temperature of 8°C (46°F) and the engine coolant temperature reaches 50°C (122°F).

For more information on TCC apply and release, see Overdrive Range – Fourth Gear TCC Released and Applied, pages 70-71.
