**SECTION A:** The instructions for a computer program are sometimes referred to as program . Computer programmers focus on  computer programs, but they also plan, test, and document computer programs. In contrast, software  apply formalized techniques to reduce the cost and complexity of software while increasing reliability. Before a program can be written, a programmer needs a clear problem , which includes a list of assumptions, a description of known information, and a specification for what constitutes a solution. Programming projects can be approached using a(n)  methodology, which requires extensive planning and documentation up front. An alternative approach is to use the  methodology in which programs are developed in iterations called . With a clear plan, a programmer can begin composing using a text editor, program editor, or  devel-

opment environment. Programs are composed of a series of statements that include a(n)  such as input or print and parameters. Those parameters may include  that represent values that can change, or  that represent unchanging values. All computer programs should include internal documentation in the form of , which are explanatory comments inserted into a computer program following language-specific symbols, such as # or keywords such as REM. A program is not complete until it has been tested to ensure that it contains no  errors, logic errors, or runtime errors. Programmers can use  methods based on rigorous logical and mathematical models to reduce the number of defects in a software product. Additional techniques for producing high-quality, secure programs include threat modeling and  programming.
