Care, Management & Prevention

## DIABETES MELLITUS DEFINED

A group of diseases that affect how your body uses glucose (blood sugar)

- Commonly called just "diabetes"

### Review of Normal Body Function

- Sugar comes from the liver and food we eat.
- Sugar enters the bloodstream when the liver releases sugar and when sugar (glucose) is produced by eating food.
- When blood sugar goes up, the pancreas (the organ behind the stomach) releases the hormone insulin.
- Insulin acts as a "key" to allow sugar into cells where it can be used for energy.
- Once in the cells, sugar is used as fuel.

### What's Different About Diabetes

- The body of a diabetic doesn't make enough insulin or can't use insulin well.
- Without enough insulin, too much blood sugar stays in the bloodstream.
- High blood sugar can cause heart disease, kidney disease, and vision loss.

## DIABETES MELLITUS OVERVIEW

More than 30.5 million people in the U.S. have diabetes.

- Roughly 1 in 4 people don't know they have diabetes.
- More than 84 million people have prediabetes and 90% don't know it.
- Diabetes is the 7th leading cause of death in the U.S.
  - Each year, at least 800,000 people die due to diabetes or related complications.
  - The number of adults diagnosed has doubled in the last 20 years.

### Historical Perspective

- 1500 BCE: Diabetes is described in many medical writings.
- 120–200 CE: The Greek physician Apollonius of Cappadocia calls the disease "diabetes," meaning "to siphon or flow through," referring to increased flow of urine.
- The Latin word mellitus, meaning "sweetened," is later added to indicate the presence of sugar in the urine.
- 1800s: Dr. Paul Langerhans discovers islets of Langerhans in the pancreas.
- It is later discovered that the pancreas is where insulin is produced, stored, and released.
- 1880s: Oscar Minkowski and Joseph von Mering discover that when the pancreas of a dog is removed, the dog urinates more frequently, sugar appears in its urine, and the dog eventually dies.
- 1921: A group of researchers isolates extract from islets of Langerhans, referred to as "injections" and later known as insulin.
- 1923: Dr. Frederick G. Banting receives the Nobel Prize in medicine for insulin discovery.
- Later 1940s–early 1950s: Extensive research on diabetes resumes after World War II.
- Mid-1950s: The American Diabetes Association (ADA) finds that most people living with diabetes is relatively uncommon and easy to manage, with little effect on a person's life.
- 1974: Congress establishes the National Commission on Diabetes to assess the impact of diabetes. It finds:
  - At least 10 million Americans have diabetes.
  - Diabetes is the 6th leading cause of death by disease.
  - Diabetes is the leading cause of blindness among people over 20.
  - 1978: The estimated annual cost of diabetes in the U.S. is more than \$5 billion.
- 2000s: The National Clinical Care Commission (NCCC) is formed to evaluate and recommend federal programs for managing metabolic and autoimmune diseases due to insulin related health issues.
- 2000s: The NCCC seeks written comments about federal diabetes prevention and treatment programs.

## TYPES OF DIABETES

### Type 1 Diabetes

- Type 1 diabetes was previously called insulin-dependent or juvenile diabetes.
- Type 1 diabetes is:
  - Caused by an autoimmune reaction.
    - The body attacks cells that make insulin, called beta cells.
    - Usually diagnosed in children and young adults.
  - In type 1 diabetes, the body makes little or no insulin. Due to a lack of insulin:
    - Blood sugar can't pass into the cells to be used as fuel.
    - The blood sugar level increases and flows through the kidneys into the urine.
  - Patients must take insulin to live.
  - About 5% of people with diabetes have type 1.
- Risk factors include:
  - Family history of diabetes
  - Environmental factors (e.g., exposure to a viral illness)
  - Presence of diabetes autoantibodies, a type of cell in the immune system
  - Being Caucasian
- Currently there is no way to prevent type 1 diabetes.

### Type 2 Diabetes

- Type 2 diabetes is also called non-insulin-dependent diabetes mellitus (NIDDM) and adult-onset diabetes.

- Type 2 diabetes:
  - Accounts for 90%–95% of all diabetes cases
  - Is usually diagnosed in middle-aged and older people
  - May be treated with diet and weight loss or medications that help cells be more sensitive to insulin
  - Is believed to be caused mainly by lifestyle factors and genes but can be caused by damage to or removal of the pancreas, pancreatic cancer, certain medications, or hormonal diseases, including Cushing's syndrome, acromegaly, and hyperthyroidism
  - Is more likely to occur in people who:
    - Are 40 or older
    - Are overweight
    - Are physically active less than 3 times a week
    - Have a family history of diabetes
    - Have a history of heart disease or stroke
    - Smokers (smokers are 20%–40% more likely to have type 2 diabetes)
    - Had gestational diabetes during pregnancy
    - Have polycystic ovary syndrome (PCOS)
    - Had a baby weighing more than 9 pounds
    - Have high blood pressure
    - Have low HDL ("good" cholesterol) or high levels of triglycerides
    - Have depression
    - Are under physical stress, such as illness or surgery
    - Take certain medications, including steroids
    - Have an autoimmune disease
    - Had pancreatic surgery or an injury, infection, or tumor affecting the pancreas
    - Have dark, thick, "velvety" skin on their armpits or around their neck
    - Are African American, Hispanic/Latino, Native American, Alaskan Native, Asian American, Native Hawaiian, or Pacific Islander
  - In type 2 diabetes, insulin is still made in normal or increased amounts, but it doesn't help the body use sugar properly.

### Diabetes & School-Aged Children

More children are being diagnosed with type 2 diabetes every year. Between school start to graduation, children, teens, and adults (ages 10–19) are the fastest growing diabetes and obesity trends. If your child has diabetes:

- Keep an adequate, healthy meal plan consisting of instant meals or snacks.

Prevent type 2 diabetes in children by encouraging them to:

- Drink water and fewer sugary drinks.
- Eat more vegetables fruits.
- Do physical activities.

### Gestational Diabetes

- Gestational diabetes:
  - In diabetes that occurs in pregnant women
  - Is believed to be caused by hormonal changes during pregnancy and genetic and lifestyle factors
  - Typically goes away after the baby is born
  - Increases the mother's and baby's risk of developing type 2 diabetes later in life
- The body becomes insulin resistant during late pregnancy due to hormones produced by the placenta.
