*Chemorheology of Polymers* Graeme A. George, Peter J. Halley, 2009      *Modeling and Prediction of Polymer*

*Nanocomposite Properties* Vikas Mittal, 2012-12-07 The book series Polymer Nano Micro and Macrocomposites provides complete and comprehensive information on all important aspects of polymer composite research and development including but not limited to synthesis, filler modification, modeling, characterization, as well as application and commercialization issues. Each book focuses on a particular topic and gives a balanced in-depth overview of the respective subfield of polymer composite science and its relation to industrial applications. With the books, the readers obtain dedicated resources with information relevant to their research, thereby helping to save time and money. This book lays the theoretical foundations and emphasizes the close connection between theory and experiment to optimize models and real-life procedures for the various stages of polymer composite development. As such, it covers quantum mechanical approaches to understand the chemical processes on an atomistic level, molecular mechanics simulations to predict the filler surface dynamics, finite element methods to investigate the macro mechanical behavior, and thermodynamic models to assess the temperature stability. The whole is rounded off by a look at multiscale models that can simulate properties at various length and time scales in one go and with predictive accuracy.

*Green Micro- and Nanocomposites* Sabu Thomas, Abitha V. K., Hanna J. Maria, 2023-10-20  
Green materials derived from renewable resources are increasingly being advocated for sustainable development due to rising environmental consciousness, waste management difficulties, depleting fossil resources, and rising oil prices to name a few. Renewable green resources such as starch, cellulose polymers, natural fibers, vegetable oils, wood, bark, cotton, wool, and silk have been utilized for food, furniture, and clothing for thousands of years. They have only recently undergone a revival as one of the most cost-effective alternatives to synthetic polymers in a variety of industrial applications, including building and construction, automotive, packaging, films, and paper coating, as well as biomedical uses. The primary drawbacks of synthetic polymers such as the release of toxic gases and vapors during incineration and the difficulty in disposing of them have prompted extensive research on new green polymeric materials with special focus on the use of biopolymers derived from renewable resources for green composite applications. This book gives a true reflection of the vast area of research in green composites as it has contributions from internationally recognized experts in the field of green polymer materials representing a wide range of disciplines, backgrounds, and expertise.

The Second Edition brings the classic text on polymer processing thoroughly up to date with the latest fundamental developments in polymer processing while retaining the critically acclaimed approach of the First Edition. Readers are provided with the complete panorama of polymer processing starting with fundamental concepts through the latest current industry practices and future directions. All the chapters have been revised and updated and four new chapters have been added to introduce the latest developments. Readers familiar with the First Edition will discover a host of new material including Blend and alloy microstructuring, Twin screw based melting and chaotic mixing mechanisms, Reactive processing, Devolatilization theory, mechanisms and industrial practice, Compounding theory and industrial practice, The increasingly important role of computational fluid mechanics, A systematic approach to machine configuration design. The Second Edition expands on the unique approach that distinguishes it from comparative texts. Rather than focus on specific processing methods, the authors assert that polymers have a similar experience in any processing machine and that these experiences can be described by a set of elementary processing steps that prepare the polymer for any of the shaping methods. On the other hand, the authors do emphasize the unique features of particular polymer processing methods and machines including the particular elementary step and shaping mechanisms and geometrical solutions. Replete with problem sets and a solutions manual for instructors, this textbook is recommended for undergraduate and graduate students in chemical engineering and polymer and materials engineering and science. It will also prove invaluable for industry professionals as a fundamental polymer processing analysis and synthesis reference. Conference Papers Index, 1987.
