

## Chapter 18 — Magmatic Activity

### 18.1 — Magmas

#### Types of Magmas

- the three main types of magmas are mafic, felsic, and ultramafic:
  - igneous is used to describe the magmas that solidify at the surface
  - felsic: has the same composition as felsic
    - Howard used felsic and eutectic as examples of these (18.2)
  - mafic: has the same composition as mafic
    - because Fe, Mg are examples of this

#### Magma Compositions

- there are a number of factors that determine type of magma (Table 18.1)
- one is viscosity — the internal resistance to flow

#### Mafic Magmas

- this normally forms large nodules in the upper mantle rock and has low viscosity — flows easier

#### Felsic Magmas

- this is found along continental margins, where elements tend to solidify into Earth's crust
- has intermediate viscosity

#### Ultramafic Magmas

- forms when molten material rises and mixes with the overlying crust
- this has a high viscosity

#### Viscosity

- the viscosity of magmas and how they flow against rock boundaries and continents:
  - the hotter the magma, the lower the viscosity
  - the amount of silicon increases the viscosity

#### Volcanoes (18.2), recall is still needed
