

## Ice Cream Lab

### Pre-Lab Questions

1. What are the materials needed for this lab?
2. What are the reasons that ice cream freezes?
3. What 3 properties are involved in making ice cream? **WHY?**
4. How is ice cream made?
5. What is the best ice cream? Choose a flavor and sundae, toppings, etc. & **Why?**

DO try this at home!

The traditional method of ice cream making, using ice and rock salt to freeze a milk and sugar mixture, involves the application of several chemistry principles:

**Colligative Properties:** Physical properties determined by the concentration of dissolved particles in a mixture, and not affected by the type of dissolved particles. Osmotic pressure (tendency of water to flow from high water concentration to low water concentration as seen when applying salt to a slug), boiling point elevation and, most importantly in this activity, freezing point depression are examples of colligative properties. When 1 mole of NaCl dissolves in a liter of water it dissociates into 1 mole of sodium ions and 1 mole of chloride ions, or a total of 2 moles of particles per liter of mixture (a 2M concentration). When 1 mole of sugar dissolves in a liter of water there are just 1 mole of sugar molecules per liter (a 1M concentration). The greater the particle concentration, the stronger the colligative effect.

Ice cream, a mixture of milk, sugar and vanilla, is really an aqueous mixture with many particles in each liter. Because of this the freezing point of ice cream is lower than that of water, so to freeze ice cream, or to keep it frozen, you must keep its temperature significantly below 0 degrees Celsius. Adding rock salt to ice produces a melting ice and saltwater mixture with a depressed freezing point in which the ice cream can be frozen.

**Heat of Fusion:** Melting a solid to form a liquid is an endothermic process. The heat of fusion of a substance is the amount of energy needed to change 1 gram of solid to liquid. The heat of fusion of water is 334 joules/gram.

Since the room temperature and the milk mixture are both warmer than the freezing point of the ice mixture, energy will be transferred into the ice mixture on all sides. This energy will be used in melting the ice (334 joules per gram melted) and the temperature of the ice mixture will stay at its freezing point as long as there is still ice to melt. This process will effectively draw energy out of the milk mixture, lowering its temperature and, eventually, freezing it!

**Hess' Law and Enthalpy Change:** The energy absorbed by the ice mixture is transferred from the room and the milk mixture so  $\Delta H_{\text{ice}} = \Delta H_{\text{milk mix}} + \Delta H_{\text{room}}$ . This is an application of Hess' Law.
